Preface ix

1 Gauss's Law, Surface Integrals, and Electric Fields 1

Motivation 1
Field concept 2
Definition of field 4
Electric field 6
Effect of the medium 8
Flux of vector field 11
Gauss's law 20
Determination of field from flux 23
Point charge 24
Coulomb's law 26
Superposition of fields 29
Summary 37
Problems 38

2 Ampère's Law, Line Integrals, and Magnetic Fields 43

Magnetic field 43
Effect of the medium 49
Magnetomotive force 51
Ampère's law 57
Determination of field from current 58
Current and current density 62
Conservation of charge 64
Magnetic field of semi-infinite filament 67
Current element 70
Superposition of fields 74
Biot-Savart law 80
Current element as dipole flow source 81
Summary 83
Problems 84

3 Emf, Field Dynamics, and Maxwell's Equations 91

Electromotive force 91
Ohm's law 95
Electric power density 96

Faraday-Maxwell law 99
How Ampère's law fails 104
Ampère-Maxwell law 107
Types of current 111
Magnetic field of a moving charge 112
Gauss's magnetic law 117
Boundary conditions 118
Extraordinary boundary conditions 124
Summary of boundary conditions and effects of conductivity 131
Superconductors, plasmas, and space charge 132
Summary 136
Problems 137

4 Maxwell's Equations and Quasistatic Analysis 147

Field equations 147
Maxwell's equations 150
Quasistatic fields 153
Surprises for circuit analysts 161
Systematic quasistatic analysis 164
Normal modes 171
Cylindrical cavity 175
Fields in a wire 176
Microstrip lines 182
Summary 185
Problems 187

5 Transmission Lines, Time Delay, and Wave Propagation 198

Transmission line parameters 198
Transmission line equations 206
Quasistatic analysis of transmission line 208
Summation of series 210
Interpretation: matched line 213
Interpretation: waves 217
Mismatched line 221
Incident and reflected waves 230
Summary 236
Problems 238

6 Steady-State Wave Transmission and Plane Waves 248

Sinusoidal steady state 248
Complex exponentials 249

Sinusoidal waves 251
Transmission lines in the steady state 253
Power transfer 263
Plane waves 270
Wave designators 273
Sinusoidal plane waves 274
Polarization 277
Linear and circular polarization 282
Optically active media 283
Incident and reflected plane waves 286
Source of plane waves 288
Load impedances for plane waves 290
Summary 296
Problems 299

7 Impedance Matching Techniques and Oblique Waves 306

Standing waves 306
Impedance measurement and standing wave ratio 308
Impedance matching with a tuning stub 315
Smith chart 320
Reflection at a mirror 324
Antireflection coating 327
Oblique incidence 332
Oblique waves as nonuniform transverse waves 333
Snell's laws 334
Transverse electric and transverse magnetic polarizations 338
Brewster's angle 343
Failure of Snell's law 346
Reactive impedances 347
Total internal reflection 350
Significance for dielectric waveguides 353
Reflection at grazing incidence 354
Summary 356
Problems 358

8 Poynting Theorems and Lossy Transmission Lines 363

Poynting theorem 363
Interpretation 365
Coaxial line 369
Complex Poynting theorem 374
Interpretation 375
General transmission lines 379
Solution to general transmission line equations 389

Interpretation 390
Plane waves in conductors 398
Summary 401
Problems 404

9 Waveguiding and Radiating Structures 412

Parallel-plate transmission line 412
Waveguides 414
Separation of variables 419
TE and TM modes 423
Interpretation of waveguide modes 429
Wave dispersion and group velocity 431
Antennas and radiation 437
Antenna terminology 443
Summary 447
Problems 448

10 Review, Epilogue, and Appendix 456

Review of concepts 456
Vistas ahead 459
Appendix 460
complex numbers 460
coordinate systems 461
vector algebra 462
dyadics 463
vector differential calculus 464
differential operations in various coordinate systems 465
vector integral calculus 467
Fourier transforms 468
convolution 469
decibel scale 469
Problems 470

Answers to Problems 474

Index 491
