Table of contents

Foreword to the French edition		xiii
Foreword to the English edition		xiv
Preface to the French edition		xv
Preface to the English edition		xvii
Acknowledgements		xix
Introduction		xxi
PART 1	SEPARATION METHODS	1
Chapter 1	**General aspects of chromatography**	**3**
1.1	General concepts of analytical chromatography	3
1.2	Classification of chromatographic techniques	4
1.3	The chromatogram	6
1.4	The ideal chromatogram and Gaussian peaks	8
1.5	Real peaks	8
1.6	The theoretical plate model	9
1.7	Column efficiency	12
1.8	Retention parameters	13
1.9	Separation factor between two solutes	15
1.10	Resolution factor between two peaks	16
1.11	The van Deemter equation in gas chromatography	17
1.12	Optimisation of a chromatographic analysis	19
	Problems	21
Chapter 2	**Gas chromatography**	**23**
2.1	Components of a gas chromatograph	23
2.2	Carrier gas and flow regulation	25
2.3	Sample introduction and the injection chamber	26
2.4	Oven	28
2.5	Columns	28

2.6 Stationary phases (liquid type) 31
2.7 Stationary phases (solid type) 33
2.8 Common detectors 33
2.9 Detectors yielding structural information 37

Appendix – Retention indices and constants related to stationary phases 38

2.10 Kovats relationship 39
2.11 Kovats retention indices 39
2.12 Stationary phase constants 40
Problems 42

Chapter 3 High performance liquid chromatography 45

3.1 Origin of HPLC 45
3.2 General scheme of an HPLC system 46
3.3 Pumps and gradient elution 47
3.4 Injectors 49
3.5 Columns 50
3.6 Stationary phases 51
3.7 Mobile phases 54
3.8 Chiral chromatography 56
3.9 Principal detectors 56
3.10 Applications 62
Problems 62

Chapter 4 Ion chromatography 65

4.1 The principle of ion chromatography 65
4.2 Mobile phases 66
4.3 Stationary phases 66
4.4 The principle of separation 68
4.5 Conductivity detectors 70
4.6 Ion suppressors 71

Appendix – Quantitative analysis by chromatography 74

4.7 Principle and basic equation 74
4.8 Recording integrators and data treatment software 75
4.9 External standard method 77
4.10 Internal standard method 78
4.11 Internal normalisation 80
Problems 81

Chapter 5 Planar chromatography 85

5.1 Planar chromatography: principles of application 85
5.2 Post-chromatography: development of the plate 86
5.3 Stationary phases 87

5.4 Retention and separation parameters 88
5.5 Quantitative TLC 89
5.6 Aspects of TLC 90
Problems 93

Chapter 6 Supercritical fluid chromatography 95

6.1 Supercritical fluids 95
6.2 Supercritical phases as mobile phases 96
6.3 Comparison of SFC with HPLC and GC 97
6.4 Instrumentation 98
6.5 SFC in chromatographic techniques 99

Chapter 7 Size exclusion chromatography 101

7.1 The principle of SEC 101
7.2 Stationary phases 102
7.3 Instrumentation 104
7.4 Domains of application 105
Problems 109

Chapter 8 Capillary electrophoresis 111

8.1 Zone electrophoresis 111
8.2 Free solution capillary electrophoresis 113
8.3 Electrophoretic mobility and electro-osmotic flow 114
8.4 Instrumentation and techniques 117
8.5 Indirect detection 119
8.6 Performance of capillary electrophoresis 119
Problems 121

PART 2 SPECTROSCOPIC METHODS 125

Chapter 9 Nuclear magnetic resonance spectroscopy 127

9.1 General description 127
9.2 Spin/magnetic field interaction for a nucleus 128
9.3 Nuclei that can be studied by NMR 130
9.4 Bloch's theory for a nucleus of $I = 1/2$ 130
9.5 Larmor's frequency 132
9.6 Chemical shift 134
9.7 The principle of obtaining an NMR spectrum 135
9.8 Relaxation processes 137
9.9 The measurement of chemical shifts 138
9.10 Shielding and deshielding of the nuclei 139

9.11	Factors influencing chemical shifts	140
9.12	Hyperfine structure: spin/spin coupling	142
9.13	Heteronuclear coupling	142
9.14	Homonuclear coupling	145
9.15	Spin decoupling and modes of operation	148
9.16	Fluorine and phosphorous NMR	150
Appendix – Quantitative NMR		**151**
9.17	Measurement of area – application to simple analysis	151
9.18	Samples containing compounds that can be identified	152
9.19	Internal standard method	153
9.20	Standard additions method	154
9.21	Analysers using pulsed NMR	155
	Problems	158
Chapter 10	**Infrared spectroscopy**	**161**
10.1	Spectral representation in the mid infrared (IR)	161
10.2	Origin of absorption bands in the mid infrared	162
10.3	Rotational-vibrational bands in the mid infrared	163
10.4	Simplified model for vibrational interactions	163
10.5	Real model for vibrational interactions	165
10.6	Rotational bands of compounds in the gas phase	166
10.7	Characteristic bands for organic compounds	167
10.8	Instrumentation	168
10.9	Optics, sources and detectors used in the mid infrared	174
10.10	Sample analysis techniques	176
10.11	Infrared microscopy	180
10.12	Archiving spectra	181
10.13	Comparison of spectra	182
10.14	Calibration of cell thickness	183
10.15	Raman diffusion	184
	Problems	186
Chapter 11	**Ultraviolet and Visible absorption spectroscopy**	**189**
11.1	General concepts	189
11.2	Molecular absorptions	191
11.3	Origin of absorption in relation to molecular orbitals	192
11.4	Donor–acceptor association	194
11.5	Isolated chromophores	194
11.6	Solvent effects: solvatochromism	195
11.7	Chromophores in conjugated systems	196
11.8	Woodward–Fieser rules	197
11.9	UV/Visible spectrophotometers	198

11.10	Quantitative analysis in the UV/Visible	204
11.11	Beer–Lambert's law	205
11.12	Visual colorimetry	207
11.13	Absorbance measurements	208
11.14	Confirmation analysis (purity control)	210
11.15	Distribution of relative errors due to instruments	211
11.16	Baseline correction	212
11.17	Multicomponent analysis (MCA)	213
11.18	Derivative spectrometry	215
	Problems	218

Chapter 12 Fluorimetry **221**

12.1	Fluorescence and phosphorescence	221
12.2	Origin of fluorescence	222
12.3	Fluorescence intensity	224
12.4	Rayleigh and Raman bands	226
12.5	Instrumentation	227
12.6	Applications	230
12.7	Chemiluminescence	231
	Problems	233

Chapter 13 X-ray fluorescence spectrometry **237**

13.1	General principle	237
13.2	X-ray fluorescence spectrum	238
13.3	Excitation modes of elements in X-ray fluorescence	239
13.4	X-ray absorption	242
13.5	Sample preparation	242
13.6	Different types of instruments	243
13.7	Quantitative analysis by X-ray fluorescence	247
13.8	X-ray fluorescence applications	248
	Problems	249

Chapter 14 Atomic absorption and flame emission spectroscopy **253**

14.1	Principles common to the two methods	253
14.2	Interpretation of the phenomena involved	254
14.3	Atomic absorption vs flame emission	255
14.4	Measurements by absorption or flame emission	257
14.5	Basic instrumentation for atomic absorption	258
14.6	Flame photometers	262
14.7	Correction of interfering absorptions	264
14.8	Physical and chemical interferences	268
14.9	Sensitivity and detection limits in AAS	269
	Problems	271

Chapter 15 Atomic emission spectroscopy **273**

15.1 Optical emission spectrophotometry (OES) 273
15.2 Excitation by inductively coupled plasma (ICP) 274
15.3 Ionisation by arc, spark or electronic impact 275
15.4 The principles of atomic emission analysis 277
15.5 Spectral lines 277
15.6 Simultaneous and sequential instruments 278
15.7 Performance 281
15.8 GC coupled to atomic emission relatively 283
15.9 Applications of atomic emission spectrometry 283
Problems 284

PART 3 OTHER METHODS 287

Chapter 16 Mass spectrometry **289**

16.1 Principles 289
16.2 The Bainbridge spectrometer 292
16.3 Magnetic analysers (EB type) 293
16.4 Time of flight (TOF) analysers 297
16.5 Ion cyclotron resonance 299
16.6 Quadrupole analysers 301
16.7 Ion traps 304
16.8 Performance of mass spectrometers 305
16.9 Sample introduction 306
16.10 Major ionisation techniques (under vacuum) 307
16.11 Atmospheric pressure ionisation (API) 311
16.12 Ion detection 314
16.13 Tandem mass spectrometry 315

Appendix – Applications in mass spectrometry **317**
16.14 Determination of empirical formulae 317
16.15 Determination of isotope ratios for an element 318
16.16 Identification using spectral libraries 320
16.17 Fragmentation of organic ions 321
Problems 325

Chapter 17 Labelling methods **329**

17.1 Principle of labelling methods 329
17.2 Isotopic dilution with a radioactive label 330
17.3 Measurement of radioisotope activity 331
17.4 Choice of a sub-stoichiometric method 334
17.5 Labelling with stable isotopes 334

17.6 Immunoenzymatic (IEA) methods of measurement 335
17.7 Other immunoenzymatic techniques 339
17.8 Advantages and limitations of the ELISA test in chemistry 340
17.9 Radio-immunoassay (RIA) 340
17.10 Immunofluorescence assay (IFA) 341
17.11 Neutron activation analysis (NAA) 341
17.12 Thermal neutrons 342
17.13 Induced activity – irradiation time 342
17.14 Detection by γ-counting – measurement principle 343
17.15 Applications 343
Problems 344

Chapter 18 Potentiometric methods 347

18.1 General principles 347
18.2 A particular ion selective electrode: the pH electrode 349
18.3 Ion selective electrodes 350
18.4 Calculations and different methods 353
18.5 Applications 356
Problems 356

Chapter 19 Coulometric and voltammetric methods 359

19.1 General principles 359
19.2 Dropping-mercury electrode 360
19.3 Continuous current polarography 361
19.4 Diffusion current 362
19.5 Pulse polarography 363
19.6 Amperometric detection in HPLC and CE 364
19.7 Special sensors 365
19.8 Stripping voltammetry 367
19.9 Coulometric measurements 368
19.10 Karl Fischer coulometric determination of water 369
19.11 Determination by the Karl Fischer method 372
Problems 374

Chapter 20 Some sample preparation methods 377

20.1 Evolution of methods 377
20.2 Solid-phase extraction using columns or discs 378
20.3 Gas-solid extraction using columns or discs 379
20.4 Headspace sample analysis 381
20.5 Supercritical fluid extraction (SFE) 383
20.6 Mineralisation by microwave digestion 384

Chapter 21 Basic statistical parameters 385

21.1 Mean value and accuracy 385
21.2 Precision and standard deviation of a group of results 386
21.3 Indeterminate or random errors 388
21.4 Confidence interval 390
21.5 Parametric tests – comparison of results 391
21.6 Rejection criteria – Q test (Dixon test) 393
21.7 Linear regression 394
21.8 Robust methods 396
21.9 Method optimisation using factorial analysis 397
Problems 398

Solutions 401

Appendix – List of acronyms 435

Bibliography 437

Table of physico-chemical constants 439

Index 441
