Contents

Dedication	v
Preface	vii
Notations	xix
1. Introduction to Bondgraphs	1
1.1 Introduction	1
1.2 The idea of Paynter	2
1.3 Bondgraphs - a first impression	4
1.4 Power variables of bondgraph	5
1.5 Bondgraphs for simple electrical circuits	7
1.6 Representation of junction elements	11
1.7 Reference power directions on the bonds	12
1.8 Bondgraph standard elements	16
1.8.1 Basic elements of bondgraphs	17
1.8.2 Constitutive laws of single port bondgraph elements	20
1.8.3 Constitutive laws of basic 2-port elements	23
1.8.4 Constitutive laws of the 3-port junction elements	26
1.8.5 Mechanical 1 and 0 junctions	28
1.9 Power direction and physical system coordinates	29
2. Causality	33
2.1 The notion of causality	33
2.1.1 Causation in physical system modelling	35
2.1.2 Information exchange and its laws	35
2.2 Causality of sources	36
2.3 Causality of I and C elements	38
2.4 Causality of R element	40
2.5 Causality of junction elements	41
2.6 Causality of two-port elements	44
2.7 Differential causality	45
2.8 Quintessence	48
2.9 Algorithm for assigning causality	51
2.10 What is wrong with a causal loop?	52
2.11 Examples on assignment of causality	54

3. Generation of System Equations	57
3.1 Selection of system states	57
3.2 Generation of system equations	58
3.3 A bondgraph with a transformer element	60
3.4 Electrical systems	61
3.5 Systems with differential causality	63
3.6 Activation and activated bonds	66
3.6.1 Power associated with activated bonds	68
3.6.2 System equations for models with activated bonds	69
3.7 Fields	71
3.7.1 System equations of motion with field elements	74
3.8 Algebraic loops	75
3.8.1 Mixed causalled fields	77
4. Art of Creating System Bondgraph	79
4.1 Introduction	79
4.2 Guide line for creating system bondgraphs	79
4.3 Bondgraphs for mechanical systems	83
4.3.1 Method of flow map	84
4.3.2 Method of effort map	88
4.3.3 Method of mixed map	90
4.4 Bondgraphs of electrical circuits	91
4.4.1 Method of gradual uncover	91
4.4.2 Point potential method	93
4.4.3 Mixed method	94
4.5 Model of an electrical transformer	95
4.6 Gyrator and transformer equivalents	100
4.6.1 Gyrator and transformer combinations	100
4.6.2 Combination of a gyrator and a source	102
4.6.3 Combination of a gyrator and storage elements	102
4.6.4 Combination of a gyrator and a resistor	104
4.6.5 Combination of a transformer and a resistor	105
4.6.6 Combination of gyrators and junction elements	105
4.6.7 Examples of gyrator equivalences	106
4.7 Model of a basic induction motor	109
4.8 Model of a 2-pole DC motor	119
4.9 Bondgraph model of a 3-phase induction motor	123
4.10 Closing remarks	127
Problems	128

5. Modelling in Noninertial Coordinates	139
5.1 Introduction	139
5.2 Principle of material objectivity	140
5.3 Mapping back to inertial frame	141
5.4 A preanalysis of rate of change of generalized momenta	153
5.5 Dynamics of rigid bodies	157
5.6 Another look at the objectivity of compliant fields	164
Problems	168
6. Nonpotential Fields	173
6.1 Nonpotential systems	173
6.2 Nonpotential fields	177
6.3 Multidimensional generalization of nonpotential fields	180
6.4 Bondgraph models of nonpotential fields	182
6.5 Alternative representation of nonpotential fields	184
6.6 An unorthodox extension of C - field	185
6.7 Rotor on hydrodynamic bearings	186
6.8 Incorporating drive dynamics in rotors with regenerative fields	189
7. Modelling of Structural Members	197
7.1 Introduction	197
7.2 Euler-Bernoulli beam model	197
7.2.1 Implementation of boundary conditions	199
7.3 Rayleigh beam model	202
7.4 Modelling of a beam column	205
7.5 Timoshenko beam model	206
7.6 Consistant inertia field	213
7.7 Modal bondgraph for continuous systems	214
7.8 Transverse vibration of a uniform beam under transverse loads and moments	216
7.9 A note of structural modelling	225
Problems	225
8. Mechanisms and Mechanical Handling Systems	229
8.1 Introduction	229
8.2 Modelling of mechanisms	229
8.2.1 Slider-crank mechanism	229
8.2.2 Four bar mechanism	231

8.2.3 How to obtain the moduli of the transformers? (use of LINKPAC)	234
8.3 Modelling of mechanical handling systems	234
8.4 Modelling and computation of driving efforts for online control	239
8.4.1 Notation	240
8.4.2 Modelling of robot	241
8.4.3 Determination of transformer moduli for 5 d.o.f robot	244
8.4.4 Derivation of effort equation	249
9. Introduction to Multibondgraph	255
9.1 Introduction	255
9.2 The various multibondgraph elements	255
9.2.1 The single port elements	256
9.2.2 The junction array	256
9.2.3 Direct sum of multibonds	256
9.2.4 The transformer and the gyrator	257
9.2.5 Field elements	258
9.3 Spatial mass spring damper system	259
9.4 A semidefinite system	259
9.5 Enhanced semidefinite system	260
9.6 The beam problem	260
9.7 Beam with gyroscopic effect	261
10. Bondgraph Modelling of Thermal Systems	263
10.1 Introduction	263
10.2 The thermal C-field for a volume of gas	265
10.3 Thermodynamic relations for C-field for an ideal gas	268
10.4 Modelling the thermal interface	270
10.5 Modelling the material interface	272
10.6 Interface through an orifice	273
10.7 Interface through finite resistor	274
10.8 Model of a toy hovercraft	276
10.9 Pseudo bondgraph for heat transfer and concept of derived bondgraph (DBG)	278
10.9.1 Pseudo bondgraph for heat transfer	278
10.9.2 Derived bondgraphs – a path to pseudo bondgraphs	283
10.9.3 Definitions	283
10.9.4 Derived constitutive laws	284
10.9.5 Back to the problem of heat transfer	290

10.9.6	Realization of windows	297
	Problems	298
11.	Modelling of Hydraulic Systems	303
11.1	Introduction	303
11.2	Power variables for hydraulic circuits	304
11.3	Turning towards hydraulic circuits	306
11.4	Appending viscous resistance to this picture	309
11.5	Hydraulic compliances	314
11.6	Effort and flow sources, hydraulic gyrator and transformer	317
11.7	Bondgraph model of a hydraulic servomotor	319
	Problems	323
12.	Approaching Control Systems	325
12.1	Introduction	325
12.2	Signal-Flow Graph from bondgraph	325
12.3	Application of bondgraphs to control systems	331
12.4	Position control of a mass on a spring-damper combination	331
12.4.1	Proportional control	331
12.4.2	Proportional-integral control	333
12.4.3	Proportional-integral-derivative control	334
12.5	Velocity control of an electric motor driving a load	337
12.6	Velocity control of moving cars connected by a spring	340
	Problems	343
13.	Designing Control Strategies in Physical Domains	347
13.1	Introduction	347
13.2	Physical equivalents	348
13.3	Control system design from physical standpoint as an inverse problem	352
13.4	Robust overwhelming control scheme	353
13.5	Impedance control	359
13.6	Physical system transpositioning in the bondgraph space	364
13.7	Implication of asymmetric transformation	368
14.	Electronic Circuits	369
14.1	Introduction	369
14.2	Operational amplifier circuits	369
14.3	Scaling circuit	373

14.4 The opamp integrator	375
14.5 Basic Wien-Bridge oscillator	376
14.6 The semiconductor diode	379
14.7 The oscillating Wien-Bridge oscillator	382
14.8 Transistor as nodic-multiport element	383
14.9 Equivalent circuits	389
14.10 A simple speed control system	390
14.11 Concluding remarks	391
Problems	393
15. Examples of Thermopneumatic, Power Hydraulic and Economic Systems - Modelling and Simulation	395
Part A : Thermopneumatic system	395
15.1 Introduction	395
15.2 Nomenclature	396
15.3 Bondgraph model	396
15.4 Results of the primary model	398
15.5 Design of the muffler	399
15.6 Implementation of the muffler	401
15.7 Results	402
Part B : Power hydraulics	405
15.8 Introduction	405
15.9 The physical system	406
15.10 Bondgraph model	406
15.11 Nomenclature	408
15.12 Transformer moduli	409
15.13 Numerical solution	409
15.14 Results of numerical solutions	410
15.15 Tractable estimation of average steady state behavior	411
15.16 Results of tractable solutions	414
Part C : Market economics	417
15.17 Introduction	417
15.18 Nomenclature	417
15.19 Bondgraph elements and their representation in economic systems	418
15.20 Implementing bondgraphs for economic systems	420

15.21 Description of models	421
15.22 Conclusions and scope	437
Appendix - A	439
A.1 Introduction	439
A.1.1 SYMB-GEN The generator module	439
A.1.2 SYMB-SIM The simulator module	440
A.1.3 SYMB-CON The control theoretical module	440
A.1.4 SYMB-STO The stochastic module	440
A.1.5 SYMB-ANI The animation module	441
A.2 Symbols environment	441
A.2.1 SYMB-GEN	442
A.2.1.1 Bondpad (The model editor)	442
A.2.1.2 Equations (The equations generator)	442
A.2.1.3 Sim-File (The mathematical model generator)	443
A.2.2 SYMB-SIM The simulator	444
A.2.3 SYMB-CON The control theoretical module	444
A.2.4 SYMB-STO The stochastic module	445
A.2.4.1 Stochastic equations editor	445
A.2.4.2 Order of moments	445
A.2.4.3 Derivation of moment equations	445
A.2.4.4 Closing of higher order moments	445
A.2.5 SYMB-ANI The animation interface	446
A.2.6 TOOLS The accessory tools	447
A.3 Examples	447
A.3.1 Dynamics of an automobile with road excitation	447
A.3.2 Velocity control of moving cars connected by spring and damper	455
Bibliography	461
Index	467
