Preface	xv
1 Basic elements of statics and dynamics	1
1.1 Discrete systems	1
1.1.1 Discrete mechanical systems	1
1.1.2 Fundamental law of dynamics	2
1.1.3 Necessity of supplementary relations	3
1.1.4 Lagrange's formalism	4
1.2 Continuous systems	5
1.2.1 Deformation of a continuum	5
1.2.2 Fundamental law of dynamics	8
1.2.3 Equations of motion in Eulerian description	11
1.2.4 Equations of motion in Lagrangian description	13
1.2.5 Common deformations	15
2 Constitutive relations and thermodynamics	17
2.1 Overview of thermodynamics	17
2.1.1 Thermodynamic equilibrium	17
2.1.2 Reversible and irreversible transformations	18

2.1.3	First principle	18
2.1.4	Second principle	18
2.2	State variables and common thermodynamic functions	21
2.2.1	State variables	22
2.2.2	Heat capacity	23
2.2.3	Free energy and energy equation	23
2.2.4	State equation	24
2.3	Irreversible processes	24
2.3.1	Thermodynamic force and flux	24
2.3.2	Onsager's reciprocity	25
2.3.3	Dissipation potential	26
2.3.4	Examples	26
2.4	Continuum thermodynamics	29
2.4.1	Local state postulate	29
2.4.2	First principle	30
2.4.3	Second principle	30
2.4.4	Discontinuity relations	31
2.4.5	Irreversible processes	32
2.5	Common constitutive laws	33
2.5.1	Common models of fluids	33
2.5.2	Common models of solids	34
2.5.3	Generalized standard models	37
2.6	Thermo-mechanical evolution	37
2.6.1	Thermo-mechanical coupling	37
2.6.2	Equations of evolution	38
3	Elements of mathematics	41
3.1	Directional derivative and derivative	41
3.2	Common functional spaces	42
3.3	Calculus of variations	44
3.3.1	Stationary condition	44
3.3.2	Examples	45
3.3.3	Local minimum and second variation	46
3.4	Convex analysis	47
3.4.1	Convex sets and convex functions	47
3.4.2	Sub-gradient and Legendre-Fenchel's transform	48
3.4.3	Minimization of convex functions	48
3.5	Variational inequality and linear complementarity	50

3.5.1	Quadratic variational inequality	50
3.5.2	Linear complementarity problem	50
3.6	Eigenvalue problem	52
3.7	Implicit function theorem	53
4	Elastic problems in small deformation	55
4.1	Elastic laws	55
4.1.1	Linear elasticity	55
4.1.2	Nonlinear elasticity	56
4.2	Static and dynamic elasticity	57
4.2.1	Dynamic equations	58
4.2.2	Static equations	59
4.3	Minimum principles and static equilibrium	59
4.3.1	Preliminary definitions	59
4.3.2	Minimum of total potential energy	60
4.3.3	Minimum of total complementary energy	60
4.3.4	The mixed principle	61
4.3.5	Illustrative example	61
4.4	Existence and uniqueness	63
4.4.1	Uniqueness	63
4.4.2	Existence	63
4.5	Elastic solids in perfect unilateral contact	64
5	Elastic-plastic problems in small deformation	67
5.1	Elastic-plastic constitutive laws	67
5.1.1	Perfect plasticity	68
5.1.2	Hardening plasticity	72
5.2	Static and dynamic responses of an elastic-plastic solid	77
5.2.1	Dynamic or quasi-static evolution	77
5.2.2	Example: bending of an elastic-plastic beam	78
5.3	Some general results on the elastic-plastic evolution	80
5.3.1	Uniqueness	81
5.3.2	Shake-down	83
5.4	Quasi-static rate problems	87
5.4.1	Complements on incremental laws	88
5.4.2	Rate problems	89
6	Stability of an equilibrium	91

6.1	Evolution and stability	91
6.1.1	Equilibrium and evolution	91
6.1.2	Stability of an equilibrium	92
6.1.3	Liapunov's functional	93
6.2	Linearization method	93
6.2.1	Liapunov's theorem	93
6.2.2	Linearized equations in mechanics	96
6.2.3	Equilibrium depending on a load parameter	96
6.3	Conservative mechanical systems	97
6.3.1	Lejeune-Dirichlet's theorem	98
6.3.2	Second variation criterion	99
6.4	Examples	101
6.4.1	Two-bar system under a follower force	101
6.4.2	Two-bar system under a conservative load	102
6.4.3	Elastica: stability of a flexible ruler	103
6.4.4	Exercise: stability of a system of two balloons	105
7	Static and dynamic bifurcation	107
7.1	Equilibrium curve of an evolving system	107
7.2	Bifurcation point and limit point	108
7.2.1	Bifurcation point	108
7.2.2	Rate problem	108
7.2.3	Limit point	109
7.3	Equilibrium curve(s) going through a given point	110
7.3.1	Regular point	111
7.3.2	Singular point	112
7.3.3	Stability exchange	114
7.3.4	Stability analysis at a singular equilibrium	114
7.4	Static bifurcation in mechanics	115
7.4.1	Static and dynamic evolutions	115
7.4.2	Illustration	116
7.5	Dynamic bifurcation	119
7.5.1	Hopf bifurcation	119
7.5.2	Post-critical analysis in Hopf's bifurcation	119
7.5.3	Stability exchange	124
7.6	Examples of Hopf's bifurcation	127
7.6.1	Elementary example	127
7.6.2	Van der Pol's oscillator	127

7.6.3	Follower load	129
8	Bifurcation analysis of conservative systems	133
8.1	Bifurcation analysis of an equilibrium curve	133
8.1.1	Detection of bifurcation points	133
8.1.2	Liapunov-Schmidt's method	134
8.1.3	Energy levels	138
8.1.4	Stability exchange	138
8.2	Examples	139
8.2.1	Buckling of a two-bar system	139
8.2.2	Buckling of a ruler	140
8.3	Multiple modes	141
8.3.1	Bifurcation analysis under multiple modes	141
8.3.2	Stability analysis under the assumption of multiple modes	143
8.4	Examples	145
8.4.1	Buckling of a triangular frame	145
8.4.2	Exercise: bifurcation of a cable-stayed column	147
9	Buckling of elastic structures	149
9.1	Elastic structures	149
9.1.1	The small strain-finite rotation assumption	149
9.1.2	Bifurcation analysis	150
9.2	Elastic beams under axial compression	151
9.3	Plates and shells	154
9.3.1	Shallow shells	154
9.3.2	Buckling of a rectangular plate under compression	155
9.4	Three-dimensional solids	157
9.4.1	Elastic laws in finite deformation	157
9.4.2	Static problems	159
9.5	Buckling under pressure	161
9.5.1	Contribution of the pressure to tangent stiffness	161
9.5.2	Example	162
9.6	Stability of a thermo-elastic equilibrium	163
9.6.1	Thermo-elastic evolution	163
9.6.2	Second variation criterion	164
10	Complements of conservative systems	167
10.1	Influence of imperfections	167

10.1.1	Geometric imperfection	167
10.1.2	Equilibrium curve with imperfection	169
10.1.3	Illustration	172
10.1.4	Multiple modes	173
10.1.5	Load imperfection	173
10.1.6	Elements of catastrophe theory	174
10.1.7	Exercise on cavitation pressure	177
10.2	System under perfect constraints	180
10.2.1	Perfect constraints	180
10.2.2	Equilibrium of a conservative system under perfect constraints	181
10.2.3	Stability under perfect constraints	182
11	Plastic buckling of beams	185
11.1	Shanley's model	185
11.1.1	Discrete model	185
11.1.2	Continuous model	188
11.2	Elastic-plastic buckling of beams	191
11.2.1	Governing equations	192
11.2.2	Bifurcation at the tangent critical load	194
11.2.3	Bifurcation at the reduced critical load	198
11.2.4	Bifurcation at an intermediate critical load	199
12	Rate problems and Hill's criteria	201
12.1	Plasticity at finite strains	201
12.2	Quasi-static evolution of solids	204
12.2.1	Governing equations	205
12.2.2	Rate problem	205
12.2.3	Rate uniqueness	206
12.3	Bifurcation analysis	206
12.3.1	Non-bifurcation criterion	206
12.3.2	Energy considerations	207
12.3.3	Energy comparison after bifurcation	209
12.4	Stability analysis	210
12.4.1	Stability criterion	210
12.4.2	Illustration	211
12.4.3	Justification of the stability criterion	212

13 Plastic bifurcation	215
13.1 Bifurcation analysis of a curve	215
13.1.1 Singular and regular points	215
13.1.2 Bifurcation under monotone loading	216
13.2 Bifurcation at the tangent critical load	217
13.2.1 Assumptions	217
13.2.2 Hutchinson's post-bifurcation analysis	219
13.2.3 Energy considerations	224
13.3 Tangent bifurcation	226
13.3.1 Triantafyllidis example	227
13.3.2 Remarks	231
14 Materials and structures in finite deformation	233
14.1 Constitutive equations at finite strains	234
14.1.1 Eulerian and updated Lagrangian descriptions	234
14.1.2 Elastic-plastic constitutive equations	235
14.1.3 The relaxed configuration model	236
14.1.4 Rate problem and major symmetry	238
14.2 Strain localization problem	239
14.2.1 Strain localization	239
14.2.2 Bifurcation by localization	239
14.2.3 Localization in plate under biaxial tension	241
14.2.4 Instability by localization	246
14.3 Buckling of elastic-plastic structures	247
14.3.1 Common tangent modulus	247
14.3.2 Buckling under compression	249
15 Standard dissipative systems	253
15.1 Standard dissipative systems	254
15.1.1 Biot's equation and generalized standard models	254
15.1.2 Invariance aspects	255
15.1.3 Standard dissipative systems	255
15.2 Time-independent behaviour	258
15.3 Rate problems	259
15.3.1 Rate equations	259
15.3.2 General results	260
15.4 Stability and non-bifurcation analysis	261
15.4.1 Stability criterion	261

15.4.2	Non-bifurcation criterion	263
15.5	Illustrations	263
15.5.1	Example of Shanley's model	263
15.5.2	Elastic-plastic solids with multiple plastic potentials	265
15.6	Some mathematical results	267
15.6.1	Visco-plastic regularization method	268
15.6.2	Continuity and uniqueness	271
16	Stability of a quasi-static evolution	273
16.1	Stability of an evolution	274
16.1.1	Stability of the solution of a non-autonomous differential equation	274
16.1.2	Linearization method	274
16.2	Stability of a visco-elastic evolution	276
16.2.1	Visco-elastic Shanley's model	276
16.2.2	Visco-elastic solids	278
16.2.3	Asymptotic stability of a quasi-static evolution	280
16.3	Stability of a visco-plastic or elastic-plastic evolution	281
16.3.1	Visco-plastic solids	281
16.3.2	Stability of a visco-plastic evolution	282
16.3.3	Stability of an elastic-plastic evolution	284
16.4	Criterion of second variation of free energy	284
16.4.1	Limit modulus	285
16.4.2	Tangent modulus versus limit modulus	286
17	Crack propagation and stability	287
17.1	Propagation of a system of interacting linear cracks	288
17.1.1	Crack propagation, stability and bifurcation	288
17.1.2	Example	290
17.2	Determination of the energy release rate	293
17.2.1	Method of geometry change	293
17.2.2	Integrals J and G_θ	294
17.3	Variations of G and second derivatives of energy	295
17.3.1	Variations of G with respect to domain	295
17.3.2	Second derivatives of energy	297
17.4	Numerical aspects	300
17.4.1	Numerical determination of G in plane elasticity	300
17.4.2	Computation of the second derivatives of energy	301

17.5	Thermo-mechanical aspects	304
17.6	The curved crack problem	308
17.6.1	Some analytical results	308
17.6.2	Mode-I criterion	311
17.6.3	Criterion of maximum release rate	312
18	Plane cracks	315
18.1	Plane cracks of arbitrary shape	315
18.2	Brittle law of propagation	318
18.3	Debonding of a membrane	319
18.3.1	Membrane bonded on a rigid substrate	319
18.3.2	Instability of a circular crack	321
18.3.3	Configurational instability of a tunnel crack	322
18.4	Viscous law of propagation	325
18.5	Delamination cracks	326
18.5.1	A problem of bonded plates	326
18.5.2	Delamination in multi-layered plates	329
18.5.3	Exercise	331
18.6	Plane cracks in a three-dimensional solid	332
18.6.1	Expression of the energy release rate	332
18.6.2	Examples	333
19	Contact with friction	335
19.1	Coulomb's law of dry friction	335
19.2	Quasi-static problems	336
19.3	Rate problems	339
19.3.1	Rate relations	339
19.3.2	Variational formulation of the rate problem	340
19.3.3	Reduced quasi-static equations	341
19.3.4	Klarbring's example	341
19.4	Important particular cases	343
19.4.1	Small deformation assumption	343
19.4.2	Hencky-type friction	344
19.4.3	Effective contact	344
19.5	Dynamic problems	345
19.5.1	Bouncing contact in a discrete system	345
19.5.2	Stick-slip vibrations of a simple oscillator	348
19.5.3	On dynamic evolutions	348

19.6	Equilibrium of a solid in contact with a moving obstacle	352
19.6.1	Solid in contact with a moving half-space	352
19.6.2	Stability of an equilibrium	353
19.6.3	Instability of the steady sliding motion	354
20	Nonlinear numerical analysis	359
20.1	Static responses of elastic solids	360
20.1.1	Incremental methods	360
20.1.2	Asymptotic methods	361
20.1.3	Passing beyond a singular point	361
20.2	Quasi-static responses of elastic-plastic and visco-plastic solids	364
20.2.1	Implicit and explicit incremental methods	364
20.2.2	Elastic-plastic solids	365
20.2.3	Viscous solids	367
20.2.4	Large time-increment methods	369
20.2.5	Remarks on steady responses	371
20.2.6	Illustrations of cyclic plasticity	371
20.3	Eigenvalue problems	374
20.3.1	Symmetric matrices	374
20.3.2	Unsymmetric matrices	376
	References	377
