<b>1. Mouse care and husbandry</b>	<b>1</b>
<i>Colin M. Hetherington, Brendan Doe and Donald Hay</i>	
<b>1. Introduction</b>	<b>1</b>
<b>2. Housing</b>	<b>1</b>
Types of facilities	1
Conventional accommodation	1
Barrier accommodation or specified pathogen free	1
Germ-free (axenic) and gnotobiotic accommodation	2
Maintenance of pathogen-free animals	2
Breeding performance and production	2
Interpretation of data	2
Collaborative experiments	2
Health screening	3
Quarantine	3
Flexible film isolators	4
Individually ventilated cage (IVC) racks	4
Fumigation	5
<b>3. Husbandry</b>	<b>8</b>
Caging	8
Bedding	9
Diet	9
Water	10
Environmental control	10
Environmental enhancement	10
<b>4. Animal identification</b>	<b>11</b>
Ear punch	11
Toe clip	11
Ear tags	11
Tail and paw tattooing	11
Electronic tags	14
<b>5. Record keeping</b>	<b>16</b>
<b>6. Breeding systems</b>	<b>16</b>
Timed mating	17
Pseudopregnancy and vasectomy	18
Superovulation	19

## Contents

7. Rederivation	20
8. Euthanasia	24
9. Transportation	24
10. Legislation	24
Acknowledgements	25
References	25
Further reading	25
<b>2. Cryopreservation and redervation of embryos and gametes</b>	<b>27</b>
<i>Peter H. Glenister and William F. Rall</i>	
1. Introduction	27
2. Proliferation of mouse models	27
Long-term maintenance of mouse models	28
Cryopreservation and banking of mouse germplasm: resources for future research	28
3. Principles of cryopreservation	29
Controlled freezing	30
Vitrification	32
4. Skills required for embryo and gamete cryopreservation	33
5. Special equipment required for cryopreservation	34
6. Cryopreservation and recovery of mouse embryos	34
Source of embryos and preferred developmental stages	35
Freezing embryos using propylene glycol as cryoprotectant	36
Recovery of embryos and live mice from embryos frozen according to <i>Protocol 2</i>	39
Freezing embryos using glycerol as cryoprotectant	40
Vitrification of embryos in vitrification solution VS3a	42
Recovery of embryos and live mice from embryos cryopreserved according to <i>Protocols 4 and 5</i>	44
7. Cryopreservation and recovery of mouse gametes	46
Cryopreservation of mouse metaphase II oocytes	47
Recovery of oocytes frozen using <i>Protocol 7</i>	48
Cryopreservation of mouse sperm	49
<i>In vitro</i> fertilization of mouse oocytes	51
8. Hints and tips	53
Embryo cryopreservation	53
Sperm cryopreservation and <i>in vitro</i> fertilization	54

## Contents

9. Long-term storage of embryos and gametes	55
Expected overall survival of cryopreserved embryos and gametes	55
10. Genetic resource banks	57
Acknowledgements	58
References	58
<b>3. Spatial analysis of gene expression</b>	<b>61</b>
<i>Stefan G. Nonchev and Mark K. Maconochie</i>	
1. Introduction	61
2. Dissection of post-implantation embryos	62
3. Whole-mount non-radioactive <i>in situ</i> hybridization	63
Precautions for RNA work	63
Theory of <i>in situ</i> hybridization	64
Generation of riboprobe	65
Fixation and pre-treatment of embryos	67
Hybridization and removal of non-specific hybrids	68
Immunodetection of signals	69
Troubleshooting	71
4. Reporter transgenes	72
General considerations	72
Introduction and uses of reporter genes	72
Detection of $\beta$ -galactosidase activity	73
Detection of alkaline phosphatase activity	74
Use of the green fluorescent protein (GFP) in transgenesis	75
5. Multiple and combined detection systems	77
Whole-mount staining of early (8.0–12.5 dpc) embryos	77
Multiple detection on cryostat and paraffin sections	78
6. Whole-mount skeletal analysis	83
Acknowledgements	85
References	85
<b>4. Mapping phenotypic trait loci</b>	<b>87</b>
<i>Benjamin A. Taylor</i>	
1. Introduction	87
2. Rationale for mapping	87
Genetic definition of trait locus	87
Identification of candidate genes	87
Genetic manipulation	87

## Contents

3. Background information for mapping phenotypic trait loci of the mouse	88
Definitions	88
Mouse genome	89
Mapping basics	89
4. A backcross mapping experiment: a model for simple mapping experiments	89
Identifying the phenotypic variant	89
Choosing a tester strain	90
Mating mutant and tester stock to produce F1 progeny	92
Producing backcross progeny	92
Classifying progeny for the target locus	93
Extracting a DNA sample	93
A linkage testing plan	93
Genotyping a subset of backcross progeny for selected markers	95
Recording data	96
Scanning data for linkage	96
Finding markers that flank the target	97
Finding closer markers	97
Analysing the complete data set to determine gene order and distance	97
Reporting linkage data	98
Size of cross	99
Markers for fine mapping	100
5. Incomplete penetrance, phenocopies and reduced viability	100
6. Mapping by intercross	101
7. QTL mapping, including the use of derivative strains	102
General nature of QTL mapping	102
QTL mapping using strain crosses	103
Strain selection	103
Backcross versus intercross	103
Number of progeny	104
Marker spacing	104
Selective genotyping	105
Significance thresholds	106
Confidence intervals	107
Fine mapping QTLs	107
Selective phenotyping	107
Progeny testing	108
Congenic strain construction	108
Advanced intercross populations	108
Derivative inbred strains for QTL mapping	109
Recombinant inbred strains	109
Congenic strains	111
Recombinant congenic strains	111
Consomic strains	112

## Contents

8. Markers	112
9. DNA pooling	114
Acknowledgements	118
References	118
<b>5. Mapping genomes</b>	<b>121</b>
<i>Paul Denny and Stephen D. M. Brown</i>	
1. Introduction	121
2. Applications of genetic and physical mapping	122
3. Genetic mapping	124
Types of genetic marker	124
Genotyping using silver-staining of SSCP gels	124
Genotyping using fluorescently-labelled dCTP incorporation into PCR products from SSLP markers, for analysis on ABI sequencers	126
Linking different maps together	128
Generating new genetic markers in specific genomic regions	129
Criteria for making the decision to construct physical maps	131
4. Physical mapping	131
Introduction to physical mapping	131
Primary contig generation	132
Clone identification using hybridization assay	134
Chromosome walking/gap filling	136
Isolating insert end sequences	136
Validation of clone contigs	138
Acknowledgements	140
References	140
<b>6. Mouse cytogenetics and FISH</b>	<b>143</b>
1. Introduction	143
<b>6A. Analysing mouse chromosomal rearrangements with G-banded chromosomes</b>	<b>144</b>
<i>Ellen C. Akeson and Muriel T. Davisson</i>	
1. Introduction	144
2. Metaphase chromosomes	144

## Contents

3. Stimulation of peripheral mouse lymphocytes by phytohaemagglutinin and lipopolysaccharide	148
Phytohaemagglutinin	148
Lipopolysaccharide	149
4. G-bands	149
5. Identifying and karyotyping mouse chromosomes	151
6. Recognizing aberrant chromosomes	152
Acknowledgement	153
References	153
<b>6B. Fluorescent in situ hybridization (FISH) to mouse chromosomes</b>	<b>154</b>
<i>Margaret Fox and Sue Povey</i>	
1. Introduction	154
2. FISH and chromosome identification	154
Repeat DNA	154
Mouse chromosome paints	155
P1 probes	155
3. Obtaining mouse chromosomes	155
4. Probes and labelling	158
DNA	158
Labelling by nick translation	158
Chromosome paints and direct labelling	159
5. FISH	160
Probe preparation	160
Hybridization	162
6. Analysis and microscopy	167
References	169
<b>7. Electronic tools for accessing the mouse genome</b>	<b>171</b>
<i>Janan T. Eppig</i>	
1. Introduction	171
2. Databases of genomic information for the mouse	171
The Mouse Genome Database (MGD)	171
The MRC Mammalian Genetics Unit	175

## Contents

<b>3. Specific data sets for genetic, radiation hybrid and physical mapping</b>	175
Genetic data	175
The Whitehead Institute/MIT map	175
EUCIB	175
Jackson Laboratory backcross	176
Copeland-Jenkins interspecific backcross	176
M. Seldin interspecific backcross	176
Radiation hybrid data	176
The Jackson Laboratory mouse radiation hybrid database	177
The EBI radiation hybrid database	177
Physical mapping data	177
Genome-wide physical map	177
X-Chromosome physical map	177
<b>4. Gene expression data</b>	178
The Gene Expression Database (GXD)	178
The mouse 3D atlas	178
<b>5. Databases of transgenics, knock-outs and other induced mutations</b>	179
The transgenic/targeted mutation database (TBASE)	179
Mouse Knockout and Mutation Database (MKMD)	179
Induced mutant resource (IMR)	179
<b>6. Animal resources lists</b>	180
International mouse strain resource (IMSR)	180
The Jackson Laboratory: JAX mice IMR, MMR, DNA resource	180
European Mouse Mutant Archive (EMMA)	181
<b>7. mgi-list, an electronic bulletin board for the mouse community</b>	181
<b>8. Summary</b>	181
References	182
<b>8. Mutagenesis of the mouse germline</b>	185
<i>Monica J. Justice</i>	
<b>1. Introduction</b>	185
<b>2. Mouse mutagenesis</b>	185
Spontaneous mutations	185
Systems for assessing mutation rate	186
Reporter genes	186
Specific locus test	187
Dominant phenotype assays	188
Other assays	188
Developing a mouse mutant resource	188
Determining functional complexity of genomic regions	189

## Contents

Human disease models	189
Allelic series	190
Unravelling biochemical or developmental pathways	190
<b>3. High-efficiency mutagenesis with <i>N</i>-ethyl-<i>N</i>-nitrosourea</b>	<b>191</b>
Mode of action	191
ENU: chemical properties, stability and half-life	191
Types of DNA lesion caused by ENU	191
Effects on protein products	192
Induction of mutations in the mouse germline	192
Doses and treatment protocols	192
Genetic screens to isolate mutations	196
Dominant mutations	196
Single-locus screens for recessive mutations	197
Three-generation breeding scheme for recessive mutations	197
Two-generation breeding scheme using deletions	199
Modifiers and sensitized pathways	200
<b>4. Practical considerations for ENU mutagenesis</b>	<b>201</b>
Breeding considerations	201
Male rotations	201
Gamete sampling for spermatogonial stem-cell mutagenesis	203
Strain background effects	206
Inbred strains to use for mutagenesis	206
F1 hybrids	207
Other observations	208
Rate of recovery to fertility	208
Mutation rates for different loci	208
Cancer susceptibility and lifespan	208
<b>5. Other mutagens</b>	<b>209</b>
Radiation mutagenesis	209
X-rays: treatment and mutations recovered	209
Other types of radiation	210
Chlorambucil	210
<b>6. Future prospects</b>	<b>211</b>
DNA repair	211
Sequence-based screening for lesions	211
The future of mutagenesis	211
References	212
<b>9. Generation of transgenic mice from plasmids, BACs and YACs</b>	<b>217</b>
<i>Annette Hammes and Andreas Schedl</i>	
<b>1. Introduction</b>	<b>217</b>
Principles and general considerations	217

## Contents

<b>3. The use of site-specific recombinases in targeting</b>	254
Excision of heterologous DNA from a targeted locus	255
Excision from ES-cell clones with recombinase expression plasmids	256
Excision in mice using transgenic mice expressing recombinase	257
Oocyte microinjection of recombinase	257
Use of recombinases to generate conditional somatic knock-outs	257
Spatially restricted knock-outs using tissue specific promoters to drive recombinase expression	258
Temporally regulated knock-outs using inducible recombinases	259
Knocking-in: recombinase mediated integration into chromosomally positioned target sites	262
<b>4. Subtle mutations without site-specific recombinases</b>	263
Double replacement	264
'Hit-and-run'	265
<b>5. Chromosome engineering in ES cells</b>	265
Deletions, inversions and duplications	265
Translocations	268
<b>6. Generating, analysing and maintaining knock-out mice</b>	268
ES-cell culture and pluripotency	268
Analysis of ES-cell potency in chimeras with tetraploid embryos	269
Equipment for injection of ES cells into embryos	269
Host embryos	271
Blastocyst injection	272
Morula injection	275
Morula aggregation	277
Transfer of embryos to the uterus	278
Genetic background	279
Maintenance of mutations as co-isogenic and congenic lines and mutant analysis in a hybrid background	280
Chimera analysis	281
Acknowledgements	282
References	282
<i>List of suppliers</i>	285
<i>Index</i>	290
