evolution

an introduction

Suranaree University of Technology

31051000656518

Stephen C. Stearns and
Rolf F. Hoekstra

Contents

Prologue 1

- Sexual cannibalism 1
- Rapid evolution 2
- Molecular resolution of old systematic problems 4
- Irreversibility: prior adaptation as subsequent constraint 5
- The problem 6

Chapter 1 The nature of evolution 7

- Introduction 7
- A brief description of evolutionary biology 8
- How evolutionary biologists think 8
- Evolutionary change: adaptive and neutral 9
- Information replicators and material interactors 13
- Adaptation 13
- Principles of genetic information transmission 18
- Principles of phenotypic design for reproductive success 22
- Speciation 28
- Microevolution and macroevolution 29
- Biological causation 29
- Summary 30
- Recommended reading 30
- Questions 31
- Landmarks in evolutionary biology 31

Chapter 2 Adaptive evolution 35

- Introduction 35
- Examples of natural selection and methods used to detect it 36
- The ways of classifying selection 45
- The strength of selection and the rate of evolutionary response 51
- The context-dependence of selection 52
- Cultural evolution 53

CONTENTS

Summary	54
Recommended reading	54
Questions	55

Chapter 3 Neutral evolution 56

Introduction	56
The relationship between genetic variation and fitness	56
Experimental evolution in <i>Escherichia coli</i>	57
Reasons for no correlation between genetic variation and fitness	60
Mechanisms that cause random evolutionary change	61
Genetic drift	66
The significance of genetic drift in molecular evolution	67
Summary	69
Recommended reading	70
Questions	70

Chapter 4 Evolution as changes in the genetic composition of populations 71

Introduction	71
Genetic systems: sexual and asexual, haploid and diploid	72
Population genetic change under selection	75
Implications of population genetics for evolutionary biology	79
Quantitative genetic change under selection	81
Evolutionary implications of quantitative genetics	87
Population and quantitative genetics are being integrated	89
Summary	91
Recommended reading	91
Questions	92

Chapter 5 The origin and maintenance of genetic variation 93

Introduction	93
Mutation generates genetic variation	94
The effect of recombination on genetic variability	95
The amount of genetic variation in natural populations	96
Equilibrium models of the maintenance of genetic variation	100
Genetic diversity at mutation–drift balance	100
Genetic diversity at mutation–selection balance	101
Genetic diversity at a balance of different selection forces	103
Genetic diversity of complex quantitative traits	107
Summary	110
Recommended reading	111
Questions	111

Chapter 6 The expression of variation 112

Introduction 112

Induced responses: one genotype can produce several phenotypes 117

Methods for analyzing patterns of gene expression 118

Genotype and phenotype are sometimes only loosely coupled 124

Reasons for loose coupling of genotype and phenotype 125

Genes controlling developmental patterns are broadly shared 126

Seasonal polyphenism in butterflies 129

Adaptive plasticity regulated by plant phytochromes 131

Summary 132

Recommended reading 134

Questions 134

Chapter 7 The evolution of sex 135

Introduction 135

Variation in sexual life cycles 138

Patterns of sexual distribution 140

Consequences of sex 141

The evolutionary maintenance of sex: theoretical ideas 143

The evolutionary maintenance of sex: empirical evidence 147

Discussion 149

Summary 150

Recommended reading 151

Questions 151

Chapter 8 The evolution of life histories and sex ratios 152

Introduction 152

The evolutionary explanation of how organisms are designed 154

The evolution of age and size at maturation 156

The evolution of clutch size and reproductive investment 158

The evolution of life span and aging 164

The evolution of sex allocation 168

Summary 175

Recommended reading 176

Questions 176

Chapter 9 Sexual selection 178

Introduction 178

How did sexual selection originate? 181

Competition for mates 182

Mate choice 184

Evidence for sexual selection 189

CONTENTS

- What determines the strength of sexual selection? 192
- Sexual selection in plants 195
- Sexual selection on gametes: sperm competition and choice by eggs 195
- Alternative explanations of sexual dimorphism 196
- Summary 196
- Recommended reading 197
- Questions 197

Chapter 10 Multilevel selection and genomic conflict 198

- Introduction 198
- Multilevel natural selection 198
- Two-level selection and genomic conflict 201
- Genomic conflict in asexual systems 203
- Genomic conflict in sexual systems 204
- The cytoplasm as battleground for genomic conflicts 207
- Importance of genomic conflicts in evolution 212
- Summary 212
- Recommended reading 213
- Questions 213

Chapter 11 Speciation 214

- Introduction 214
- What is a species? 215
- The origin of species 219
- The experimental evidence 228
- Summary 229
- Recommended reading 230
- Questions 230

Chapter 12 Systematics 232

- Introduction 232
- What is a phylogeny? 240
- Cladistics 241
- Molecular data and homoplasy 244
- The theory and rationale of tree building 247
- The genealogy of genes and the phylogeny of species 250
- Summary 251
- Recommended reading 251
- Questions 251

Chapter 13 The history of life I: the evolutionary theater 253

- Introduction 253
- Some insights of history 253
- The geological theater 260
- Local geological catastrophes 269
- The mass extinctions: when, who and how 271
- Patterns of stasis, speciation, and morphological change 274
- Summary 277
- Recommended reading 278
- Questions 278

Chapter 14 The history of life II: key events in evolution 280

- Introduction 280
- The origin of life 281
- The evolution of chromosomes 283
- The origin of multicellularity 284
- The evolution of reproductive and non-reproductive units: germ line and soma 285
- Principles involved in key evolutionary events 286
- Summary 290
- Recommended reading 291
- Questions 291

Chapter 15 Molecular insights into history 292

- Introduction 292
- Deep time: From the first bacteria to the first eucaryotes 293
- The evolution of developmental mechanisms 297
- African Eve and polymorphisms in genes for immune response 303
- Recent human migrations and colonizations 310
- Summary 314
- Recommended reading 314
- Questions 315

Chapter 16 Comparative methods 316

- Introduction 316
- Examples of phylogenetic trait analysis 317
- An example of comparative trend analysis 321
- Species are not independent samples 323
- General comments on comparative methods 328
- Summary 329
- Recommended reading 329
- Questions 330

CONTENTS

Chapter 17 Conclusion 331

- The reality and reliability of evolution 331
- Evolutionary biology has a complex causal structure 331
- Evolution is happening all around us—and to us 332
- The scope of evolutionary explanation 332
- The major preoccupations of evolutionary biology 333
- Two major puzzles: the fixed and the variable 334
- Other unsolved problems 335
- What are the limits to evolutionary prediction? 336
- Looking ahead 337
- Summary 338
- Recommended reading 339
- Questions 340

Glossary 341

Literature cited 349
