

Electric Power System Applications of Optimization

James A. Momoh

Contents

<i>Series Introduction</i>	H. Lee Willis	<i>iii</i>
<i>Preface</i>		<i>v</i>

1. Introduction	1
I. Structure of a Generic Electric Power System	1
II. Power System Models	3
III. Power System Control	5
IV. Power System Security Assessment	9
V. Power System Optimization as a Function of Time	12
VI. Review of Optimization Techniques Applicable to Power Systems	14
References	17
2. Electric Power System Models	19
I. Introduction	19
II. Complex Power Concepts	20
III. Three-Phase Systems	22
IV. Per Unit Representation	29
V. Synchronous Machine Modeling	30
VI. Reactive Capability Limits	32
VII. Prime Movers and Governing Systems	33
VIII. Automatic Gain Control	36
IX. Transmission Subsystems	43
	ix

X.	Y-Bus Incorporating the Transformer Effect	45
XI.	Load Models	52
XII.	Available Transfer Capability (ATC)	54
XIII.	Illustrative Examples	57
XIV.	Conclusions	60
XV.	Problem Set	60
	References	63
3.	Power-Flow Computations	65
I.	Introduction	65
II.	Types of Buses for Power-Flow Studies	66
III.	General Form of the Power-Flow Equations	68
IV.	Practical Modeling Considerations	71
V.	Iterative Techniques for Power-Flow Solution	75
VI.	Practical Applications of Power-Flow Studies	106
VII.	Illustrative Examples	107
VIII.	Conclusion	112
IX.	Problem Set	113
	References	117
4.	Constrained Optimization and Applications	119
I.	Introduction	119
II.	Theorems on the Optimization of Constrained Functions	119
III.	Procedure for the Optimizing Constrained Problems (Functions)	121
IV.	Illustrative Problems	122
V.	Power Systems Application Examples	124
VI.	Illustrative Examples	133
VII.	Conclusion	138
VIII.	Problem Set	139
	References	141.
5.	Linear Programming and Applications	143
I.	Introduction	143
II.	Mathematical Model and Nomenclature in Linear Programming	143
III.	Linear Programming Solution Techniques	146
IV.	Duality in Linear Programming	161
V.	Mixed Integer Programming	163

VI. Sensitivity Methods for Postoptimization in Linear Programming	170
VII. Power Systems Applications	182
VIII. Illustrative Examples	183
IX. Conclusion	190
X. Problem Set	190
References	195
6. Interior Point Methods	197
I. Introduction	197
II. Karmarkar's Algorithm	199
III. The Projection Scaling Method	201
IV. The Dual Affine Algorithm	202
V. The Primal Affine Algorithm	203
VI. The Barrier Algorithm	205
VII. Extended Interior Point Method for LP Problems	206
VIII. Feasible Interior Sequence	207
IX. Extended Quadratic Programming Using Interior Point (EQIP) Method	211
X. Illustrative Examples	214
XI. Conclusions	225
XII. Problem Set	225
References	226
7. Nonlinear Programming	229
I. Introduction	229
II. Classification of NLP Problems	230
III. Sensitivity Method for Solving NLP Variables	231
IV. Algorithm for Quadratic Optimization	235
V. Barrier Method for Solving NLP	237
VI. Illustrative Examples	243
VII. Conclusion	250
VIII. Problem Set	250
References	254
8. Dynamic Programming	257
I. Introduction	257
II. Formulation of Multistage Decision Process	258

III.	Characteristics of Dynamic Programming	260
IV.	Concept of Suboptimization and the Principle of Optimality	261
V.	Formulation of Dynamic Programming	263
VI.	Backward and Forward Recursion	268
VII.	Computational Procedure in Dynamic Programming	278
VIII.	Computational Economy in DP	279
IX.	Systems with More than One Constraint	279
X.	Conversion of a Final Value Problem into an Initial Value Problem	282
XI.	Illustrative Examples	282
XII.	Conclusions	287
XIII.	Problem Set	288
	References	291
9.	Lagrangian Relaxation	293
I.	Introduction	293
II.	Concepts	294
III.	The Subgradient Method for Setting the Dual Variables	295
IV.	Setting T_k	302
V.	Comparison with Linear Programming-Based Bounds	307
VI.	An Improved Relaxation	309
VII.	Summary of Concepts	310
VIII.	Past Applications	311
IX.	Summary	313
X.	Illustrative Examples	320
XI.	Conclusions	321
XII.	Problem Set	322
	References	323
10.	Decomposition Method	325
I.	Introduction	325
II.	Formulation of the Decomposition Problem	326
III.	Algorithm of Decomposition Technique	328
IV.	Illustrative Example of the Decomposition Technique	329
V.	Conclusions	336

VI. Problem Set	336
References	338
11. Optimal Power Flow	339
I. Introduction	339
II. OPF—Fuel Cost Minimization	340
III. OPF—Active Power Loss Minimization	344
IV. OPF—VAR Planning	349
V. OPF—Adding Environmental Constraints	358
VI. Commonly Used Optimization Technique (LP)	360
VII. Commonly Used Optimization Technique (NLP)	373
VIII. Illustrative Examples	387
IX. Conclusions	394
X. Problem Set	395
References	397
12. Unit Commitment	401
I. Introduction	401
II. Formulation of Unit Commitment	403
III. Optimization Methods	406
IV. Illustrative Example	410
V. Updating $\lambda_n(t)$ in the Unit Commitment Problem	422
VI. Unit Commitment of Thermal Units Using Dynamic Programming	425
VII. Illustrative Problems	434
VIII. Conclusions	434
IX. Problem Set	436
References	441
13. Genetic Algorithms	443
I. Introduction	443
II. Definition and Concepts Used in Genetic Computation	444
III. Genetic Algorithm Approach	446
IV. Theory of Genetic Algorithms	449
V. The Schemata Theorem	452
VI. General Algorithm of Genetic Algorithms	454
VII. Application of Genetic Algorithms	455
VIII. Application to Power Systems	457
IX. Illustrative Examples	469

IX. Conclusions	471
XI. Problem Set	471
References	472
Epilog	473
Index	475
