Science

DARBESHWAR ROY

CONTENTS

Preface

vii

1. Genes, Chromosomes and Characters

1

- 1.1 The Gene 1
- 1.2 Biochemistry of the Gene 2
- 1.3 Chromosomes 5
- 1.4 Characters 6
- 1.5 Protein Synthesis 6
- 1.6 Plant Characters 8
 - Seed Characters 8
 - Root Characters 16
 - Characters associated with resistance to element toxicity 17
 - Stem characters 17
 - Characters associated with drought resistance 17
 - Characters associated with heat resistance 18
 - Chilling or cold resistance 18
 - Flood tolerance 18
 - Photosynthesis 18
 - Respiration 21
 - Translocation 21
- 1.7 Environmental factors 21
- References 21

2. Analysis of Qualitative Traits

24

- 2.1 Gene action and interaction 24
 - Dominance 24
 - Over-dominance 25
 - Co-dominance 26
 - Multiple alleles 26
 - Epistasis or non-allelic interaction 26
 - Test for allelism 27
- 2.2 Application of laws of probability 27
 - Application to cases of two or more genes 28
 - Types of probability 29
 - Binomial probability 29
 - Multinomial probability 30
- 2.3 Test of goodness of fit 31
 - Two factor segregation 31
 - Test of heterogeneity of families 31
 - Testing of independence 32

2.4	Experimental size	33	
	Distinction between two hypotheses	33	
2.5	Linkage and pleiotropy	34	
	Detection of linkage	35	
	Estimation of recombination frequency	36	
	Efficiency of different types of families	37	
	Factors affecting the recombination frequency	37	
	Pleiotropy	38	
2.6	Extra chromosomal inheritance	38	
	Criterion for extra chromosomal inheritance	39	
	Cell organelles	40	
2.7	Sex determination	41	
2.8	Expression of qualitative gene(s)	43	
	Penetrance and expressivity	43	
2.9	Estimation of gene frequency	43	
	Incomplete dominance	44	
	Multiple alleles	44	
2.10	Estimation of genetic diversity	45	
	References	45	
3.	Incompatibility and Male Sterility		47
3.1	Incompatibility	47	
	Genetic basis of incompatibility	47	
	Utility of self-incompatibility	50	
3.2	Physiological/biochemical basis of incompatibility	51	
3.3	Gene function in incompatibility	51	
3.4	Identification of S-allele genotype	52	
	Reciprocal cross procedure	52	
	Compatibility/incompatibility reaction	55	
3.5	Evolution of incompatibility mechanism	55	
3.6	Break down of incompatibility	56	
	In-vitro fertilization	57	
3.7	Male sterility	57	
	Genetic male sterility	57	
	Cytoplasmic male sterility	67	
	References	58	
4.	Enzymes/Isozymes		61
4.1	Definition, types and banding pattern	61	
4.2	Separation and identification of isozyme	61	
4.3	Enzymes to be studied	64	
4.4	Types of material to be used in the analysis	64	
4.5	Genetic control of metabolism	65	
4.6	Isozymes in the study of quantitative variation	65	
4.7	Limitations of isozymes in assessing quantitative variation	66	
4.8	Isozymes as selection criteria in heterosis breeding	66	
	References	67	

5. Analysis of Quantitative Traits	68
5.1 Theories of quantitative variability	70
5.2 Description of normal distribution curve	71
Mean	71
Mode and Median	72
Variance and covariance	73
Range	73
Skewness and kurtosis	73
5.3 Threshold variability	74
5.4 Meristic variability	76
5.5 Poisson distribution	76
5.6 Modifications of binomial and Poisson distribution	77
Gamma distribution	77
Hypergeometric distribution	77
5.7 Biomodal and multimodal distributions	78
References	78
6. Statistical Estimation, Tests, Models and Designs	80
6.1 Estimation and inference	80
Methods of estimation	80
6.2 Test of significance	81
Chi-square test	81
F-test	82
The <i>t</i> -test	83
Z-distribution	84
Relationship between different distributions	84
Non-central chi-square	84
Non-central F	84
6.3 Statistical models and expectation of mean squares	84
Fixed Model	85
Random model	85
Mixed model	86
6.4 Experimental designs and calculation of mean squares	86
Randomized complete block design	87
Nested design	87
Cross-classified design	88
Factorial experiment	89
Analysis of co-variance	90
6.5 Correlation and regression analysis	91
Correlation coefficient	91
Regression analysis	92
Joint regression analysis	93
Multiple regression	94
Partial correlation and regression	94
Multiple correlation	94
6.6 Orthogonal polynomial	95
6.7 Non-parametric statistic	96
6.8 Multivariate analysis	96
Principal component analysis	96
Factor analysis	97

- 6.8 Canonical analysis 97
- Discrimination and classification 98
- Principal co-ordinate analysis 98
- 6.9 Growth curves 100
- Competition 101
- References 102

7. Analysis of Means

103

- 7.1 Scaling tests 104
- 7.2 Estimation of parameters 104
- 7.3 Epistasis or non-allelic interaction 106
- 7.4 Estimation of coefficient of dispersion 108
- 7.5 Concept of average effect of gene 109
- 7.6 Other models of estimation of genetic effect 110
- 7.7 Detection of epistasis by other methods 112
- References 114

8. Analysis of Variance and Co-Variance

116

- 8.1 Partitioning of variance 116
- 8.2 Estimation of variances in generations derived from cross of two pure breeding lines 116
- 8.3 Covariance/correlation 118
- 8.4 Estimation of variances in random mating population 119
- 8.5 Development of progenies 119
- 8.6 Estimation of components of variation 120
- 8.7 Expectations of σ_w^2 , σ_b^2 , σ_f^2 , σ_{fjm}^2 and $\sigma_{f \times m}^2$ 122
- Covariance between relatives in random mating population 124
- 8.8 NCM III and TTC 124
- NCM III 124
- TTC 125
- 8.9 Variants of TTC 127
- TTC with population of inbred lines 127
- TTC (selfed families) 128
- 8.10 Model fitting to mean squares 128
- 8.11 Comparison of efficiency of the mating designs 129
- 8.12 Uses of estimates of components of variation 134
- 8.13 Negative estimates of variance components 134
- 8.14 Comparison of variability 134
- 8.15 Partitioning of covariance/correlation 135
- Partitioning of correlation coefficient 135
- Calculation of additive genetic correlation 136
- Standard error of correlation coefficient 136
- 8.16 Intra-class correlation 137
- References 137

9. Diallel Analyses

140

- 9.1 Full diallel analysis 140
- 9.2 Half diallel analysis 142

- 9.3 Genetical structure of quantitative traits 142
 - W_r-V_r analysis 143
- 9.4 Estimation of genetical components of variation 145
 - F₂ diallel 146
- 9.5 Diallel analysis with heterozygous parents 148
 - Identification of heterozygous parent(s) 149
- 9.6 Combining ability analysis 149
 - Estimation of GCA and SCA effect 150
- 9.7 Partial diallel 152
 - Number of crosses per parent in partial diallel 153
- 9.8 Number of parents, family size and number of replications in diallel 154
- 9.9 Reference population in diallel 154
- 9.10 Comparison with other matting designs 157
- 9.11 Assumptions under diallel analysis 157
- 9.12 Varietal diallel 157
- 9.13 Triallel analysis 158
 - Order of lines in three-way hybrids 160
 - References 160

10. Genotype × Environment Interaction

163

- 10.1 Definition 163
- 10.2 ANOVA for genotype × environment interaction 164
- 10.3 Types of environment 166
- 10.4 Approaches to analysis of $g \times e$ 167
 - Regression analysis 167
 - Analysis of non-linear genotypes x environment interaction 176
 - Limitations with regression models 179
- 10.5 Multivariate analysis of genotype x environment interaction 179
 - Principal component analysis 180
 - Biplot method 180
- 10.6 Non-parametric approach 181
 - Cluster analysis 182
 - Ranks of genotypes 183
 - Study of environmental factors 184
- 10.7 Genetical analysis of genotype x environment interactions 185
 - Generations derived from cross of two pure breedings lines 186
 - Multiple mating designs 188
 - Interaction between epistatic gene action and environment 191
- 10.8 Genetic control of environmental sensitivity 192
 - Theories of environmental sensitivity 192
 - General or specific nature of genotypes involved in environmental sensitivity 193
 - Choice of selection environment and the effect of the chosen environment on the properties of selected lines 194
 - References 195

11. Analysis of Reciprocal Differences

199

- 11.1 Maternal effects 199
- 11.2 Estimation of maternal effects 200
 - Generations derived from the cross of two pure breeding lines 200

	Generation means	200	
	Generation variances	201	
	Multiple mating designs	202	
11.3	Detection of epistasis and linkage of epistatic genes in the presence of reciprocal differences	203	
11.4	Reciprocal effects model	203	
11.5	Co-variances between relatives	209	
11.6	Sex-linkage	209	
11.7	Sex limitation	211	
	References	213	
12.	Linkage and Epistasis		215
12.1	Linkage	215	
12.2	Effect of random mating on linkage disequilibrium	216	
12.3	Effect of linkage on variances of advancing generations derived by selfing the cross between pairs of pure breeding lines	216	
12.4	Detection of linkage disequilibrium	218	
12.5	Generation that yields an approximate estimate of DVF_{∞}	219	
12.6	Effect of linkage on covariances	220	
12.7	Linkage vs. pleiotropy	220	
12.8	Epistasis	221	
12.9	Effect of non-allelic interaction on estimation of variance components	223	
	Biases in D and H components obtained from TTC	223	
12.10	Comparison of tests of epistasis	224	
12.11	Epistasis in random mating population	224	
12.12	Detection of linked epistasis	226	
	References	228	
13.	Heterosis and Inbreeding Depression		230
13.1	Heterosis	230	
13.2	Theories of heterosis	230	
13.3	Expressing heterosis in terms of biometrical parameters	232	
	Generation means	232	
	Variances	233	
13.4	Effect of linkage disequilibrium on dominance ratio	233	
13.5	Effect of interaction on dominance ratio	234	
13.6	Environmental heterosis	235	
13.7	Dominance ratio	236	
13.8	Maternal effects in heterosis	236	
13.9	Heterosis in population cross	230	
13.10	Misinterpretation of heterosis	239	
13.11	Genetic distance/divergence	239	
	Estimation of genetic distance	240	
	Cluster formation	240	
9.1	Intra- and inter-cluster distances	241	
9.2	How to genetic parameters in the estimation of genetic distance	241	
13.12	Inbreeding depression	242	

13.13	Inbreeding in random mating population	243
13.14	Other system of inbreeding	244
	References	245

21. Genetic Structure of Population

- 21.1 The Hardy-Weinberg Equilibrium 309
 - Testing goodness of fit 309
 - Extension of H.W. equilibrium to case of multiple alleles, sex-linked genes, and polygenic inheritance 310
 - Sex-linked loci 311
 - Polygenic traits 311
- 21.2 Changes in gene frequency 312
 - Effects of non-random-mating 312
 - Self fertilization 312
 - Sib-mating 312
 - Assortative mating 312
 - Negative assortative mating 313
- 21.3 Mutation 313
 - Balance between mutation and selection 314
- 21.4 Selection 316
 - Complete elimination of recessive homozygotes 317
 - Balance between selection and inbreeding 318
- 21.5 Competitive selection 318
- 21.6 Migration 319
 - Balance between selection and migration 319
 - Models for studying the population structure 319
- 21.7 Drift 320
 - Effective population size 321
 - Random genetic drift in natural populations 322
- 21.8 The Founder principle 323
- 21.9 Gametic selection 324
- 21.10 Meiotic drive 324
- 21.11 Genetic load 325
 - Segregational load 325
 - Mutational load 326
 - References 327

22. Evolution

- 22.1 Theories of evolution 329
- 22.2 Speciation 330
- 22.3 Founder induced speciation 332
- 22.4 Reproductive isolation 333
- 22.5 Geographical or spatial isolation 333
 - Allopatric speciation 333
 - Sympatric speciation 333
- 22.6 Adaptation 334
- 22.7 Cytological and molecular basis of evolution 335

22.5	Translocations and inversion	335	
22.6	Duplication	335	
22.7	Molecular evolution	336	
22.8	Crop evolution	337	
22.9	Domestication of crop species	337	
22.10	Centres of diversity and centres of domestication	338
