WILEY
Adaptive Filtering and Change Detection
FREDRIK GUSTAFSSON

Contents

Preface ix

Part I: Introduction 1

1. Extended summary 3
1.1. About the book . . . 3
1.2. Adaptive linear filtering . . . 8
1.3. Change detection . . . 17
1.4. Evaluation and formal design . . . 26

2. Applications 31
2.1. Change in the mean model . . . 32
2.2. Change in the variance model . . . 35
2.3. FIR model . . . 37
2.4. AR model . . . 39
2.5. ARX model . . . 42
2.6. Regression model . . . 46
2.7. State space model . . . 49
2.8. Multiple models . . . 49
2.9. Parameterized non-linear models . . . 51

Part II: Signal estimation 55

3. On-line approaches 57
3.1. Introduction . . . 57
3.2. Filtering approaches . . . 59
3.3. Summary of least squares approaches . . . 59
3.4. Stopping rules and the CUSUM test . . . 63

3.5. Likelihood based change detection 70
3.6. Applications 80
3.A. Derivations 84

4. Off-line approaches **89**
4.1. Basics 89
4.2. Segmentation criteria 91
4.3. On-line local search for optimum 94
4.4. Off-line global search for optimum 98
4.5. Change point estimation 102
4.6. Applications 106

Part III: Parameter estimation **111**

5. Adaptive filtering **113**
5.1. Basics 114
5.2. Signal models 115
5.3. System identification 121
5.4. Adaptive algorithms 133
5.5. Performance analysis 144
5.6. Whiteness based change detection 148
5.7. A simulation example 149
5.8. Adaptive filters in communication 153
5.9. Noise cancelation 167
5.10. Applications 173
5.11. Speech coding in GSM 185
5.A. Square root implementation 189
5.B. Derivations 190

6. Change detection based on sliding windows **205**
6.1. Basics 205
6.2. Distance measures 211
6.3. Likelihood based detection and isolation 218
6.4. Design optimization 225
6.5. Applications 227

7. Change detection based on filter banks **231**
7.1. Basics 231
7.2. Problem setup 233

7.3. Statistical criteria 234
7.4. Information based criteria 240
7.5. On-line local search for optimum 242
7.6. Off-line global search for optimum 245
7.7. Applications 246
7.A. Two inequalities for likelihoods 252
7.B. The posterior probabilities of a jump sequence 256

Part IV: State estimation **261**

8. Kalman filtering **263**
8.1. Basics 264
8.2. State space modeling 267
8.3. The Kalman filter 278
8.4. Time-invariant signal model 286
8.5. Smoothing 290
8.6. Computational aspects 295
8.7. Square root implementation 300
8.8. Sensor fusion 306
8.9. The extended Kalman filter 313
8.10. Whiteness based change detection using the Kalman filter . . 324
8.11. Estimation of covariances in state space models 326
8.12. Applications 327

9. Change detection based on likelihood ratios **343**
9.1. Basics 343
9.2. The likelihood approach 346
9.3. The GLR test 349
9.4. The MLR test 353
9.5. Simulation study 365
9.A. Derivation of the GLR test 370
9.B. LS-based derivation of the MLR test 372

10. Change detection based on multiple models **377**
10.1. Basics 377
10.2. Examples of applications 378
10.3. On-line algorithms 385
10.4. Off-line algorithms 391
10.5. Local pruning in blind equalization 395

10.A.Posterior distribution 397

11. Change detection based on algebraical consistency tests 403
11.1. Basics 403
11.2. Parity space change detection 407
11.3. An observer approach 413
11.4. An input-output approach 414
11.5. Applications 415

Part V: Theory 425

12. Evaluation theory 427
12.1. Filter evaluation 427
12.2. Evaluation of change detectors 439
12.3. Performance optimization 444

13. Linear estimation 451
13.1. Projections 451
13.2. Conditional expectations 456
13.3. Wiener filters 460

A. Signal models and notation 471

B. Fault detection terminology 475

Bibliography 477
