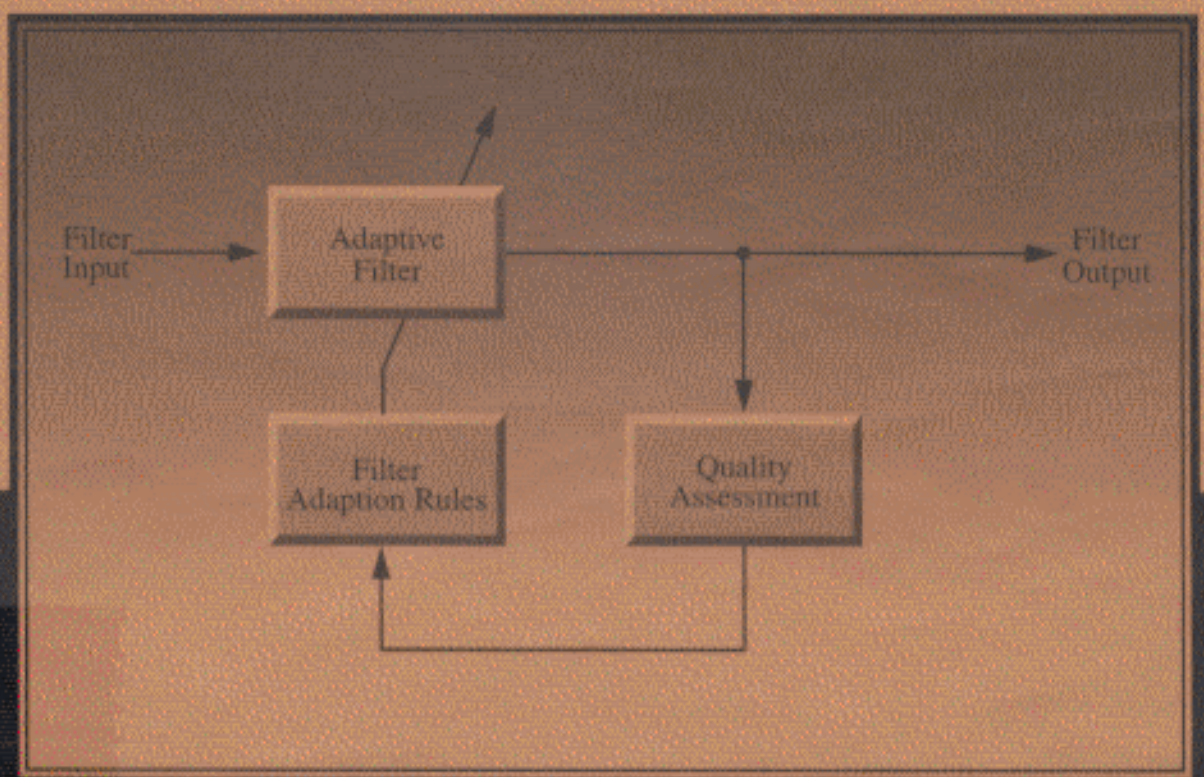
THEORY AND DESIGN OF ADAPTIVE FILTERS



JOHN R. TREICHLER
C. RICHARD JOHNSON, JR.
MICHAEL G. LARIMORE

Contents

PREFACE *xi*

1 THE NEED FOR ADAPTIVE FILTERING *1*

1.1 Removal of Power Line HUM from Medical Instruments 2

1.2 Equalization of Troposcatter Communication Signals 4

1.3 The Modeling of Physical Processes 9

1.4 Enhancing Reception Quality Using an Array of Antennas 11

1.5 Generality and Commonality 15

1.6 Problems 17

2 BASIC PRINCIPLES OF ADAPTIVE FILTERING *21*

2.1 The FIR Linear Combiner 22

2.2 Number Guessing Games 24

2.2.1 Single Integer Guessing Games, 24

2.2.2 Multiple Integer Guessing Games, 26

2.2.3 Multiple Real Numbers Guessing Games, 32

2.3 Adaptive Filter Algorithm Interpretation 35

2.4 Problems 37

3 AN ANALYTICAL FRAMEWORK FOR DEVELOPING ADAPTIVE ALGORITHMS 39

3.1 Background and Direction 39

3.2 The Least Squares Problem 40
3.2.1 Basic Formulation, 40
3.2.2 Reduction to the Normal Equations, 41
3.2.3 Direct Solution for the Optimal Vector $\mathbf{W}_{ss}^{o}$, 45
3.2.4 The Meaning of $\mathbf{P}_{ss}$ and R_{ss}, 46
3.2.5 Examples, 47
3.2.6 Two Solution Techniques, 51
3.2.7 Consolidation, 54

3.3 The Least Mean Squares Problem 55
3.3.1 Formulation, 55
3.3.2 A Brief Review of Stochastic Processes , 55
3.3.3 Development of the Normal Equations, 62
3.3.4 The Ensemble Average Auto- and Cross-Correlation Functions, 63
3.3.5 Examples, 64
3.3.6 Consolidation, 68

3.4 Properties of the Solution 70
3.4.1 Evaluation of the Performance Function, 70
3.4.2 The Positivity of R, 71
3.4.3 Examples Revisited, 73
3.4.4 Decompositions Based on the Eigensystem of R, 74
3.4.5 A Geometrical View of the Squared-Error Performance Function, 77
3.4.6 Another Useful View—Spectral Decomposition of the Filter Input, 83

3.5 Summary and Perspective 86

3.6 Problems 88

4 ALGORITHMS FOR ADAPTING FIR FILTERS 91

4.1 Introduction 91

4.2 Search Techniques 92
4.2.1 The Gradient Search Approach, 92
4.2.2 Approximation of the Gradient, 94
4.2.3 The Average Convergence Properties of LMS, 95
4.2.4 The Effects of a Singular Autocorrelation Matrix, 98
4.2.5 Using the Input Signal Spectrum to Predict the Performance of an LMS-Adapted FIR Filter, 99
4.2.6 Related Approximate Gradient Search Algorithms, 102
4.2.7 Simplified and Modified Versions of the LMS Algorithm, 106

4.2.8 *Gradient Noise, Weight Noise, and the Concept of Misadjustment, 110*
4.2.9 *The Effect of the Adaptation Constant on Tracking Performance, 111*
4.2.10 *The Concept of the Adaptive Learning Curve, 113*

4.3 Recursive Solution Techniques 116
4.3.1 The Motivation for Recursive Algorithms, 116
4.3.2 Recursive Least Squares (RLS), 116
4.3.3 "Fast" RLS Algorithms, 124

4.4 An Example Using Both LMS and RLS 128

4.5 Summary and Perspective 133

4.6 Problems 135

5 ALGORITHMS FOR ADAPTING IIR FILTERS *145*

5.1 Introduction 145
5.1.1 A Justification of IIR Modeling, 145
5.1.2 Alternate Realizations and Altered Algorithms, 148
5.1.3 Adaptive IIR Filter Algorithm Construction, 149

5.2 Gradient Descent Minimization of Squared Prediction Error 151
5.2.1 A Less Expensive Gradient Approximation, 153
5.2.2 Stability Check and Projection, 154

5.3 Parameter Identification Format and Stability Theory Interpretation 155
5.3.1 Homogeneous Error System Stability Formulation, 158
5.3.2 Error Filtering, 160

5.4 Filtered-Error and Filtered-Regressor Algorithms 161

5.5 Steiglitz–McBride Algorithm 163

5.6 IIR Whitener 167

5.7 ARMAX Modeling 170

5.8 Summary 173

5.9 Problems 176

6 ADAPTIVE ALGORITHMS FOR RESTORING SIGNAL PROPERTIES *181*

6.1 Introduction 181

6.2 Classical Approaches to Coping with the Lack of a Reference Waveform 183
6.2.1 Using a Function of the Input Signal Itself as the Reference, 183
6.2.2 Prearrangement of a Suitable Reference Signal, 184
6.2.3 Using A Priori *Statistical Knowledge about the Inputs to Avoid the Need for a Reference Signal, 185*

6.3 The Property-Restoration Concept 186

6.4 The Constant-Modulus Adaptive Algorithm 187
6.4.1 The Filter Structure, 188
6.4.2 The Error Signal, 188
6.4.3 The Adaptive Algorithm, 189
6.4.4 An Example Using the Gradient Descent Version of CMA, 190

6.5 Extension of CMA to Data Signals 193
6.5.1 "Constant Envelope" Data Signals, 193
6.5.2 Quadrature-Amplitude Modulation (QAM) and Other Nonconstant-Envelope Signals, 195
6.5.3 Analytical Considerations in the Design of Property-Restoration Algorithms, 197

6.6 Summary 198

6.7 Problems 199

7 IMPLEMENTATION ISSUES 207

7.1 Introduction 207

7.2 Sizing Considerations 210

7.3 Real-Time Operation 213

7.4 Implementation Efficiencies 214
7.4.1 Data Storage, 214
7.4.2 Symmetric Filtering, 215
7.4.3 Complex Filtering and Narrowband Signals, 218
7.4.4 Algorithmic Shortcuts, 222
7.4.5 Cyclostationary Filtering, 229
7.4.6 Algorithmic Leaking, 231

7.5 Frequency Domain Implementations 232
7.5.1 Fast Output Convolution: A Complexity Analysis, 232
7.5.2 Fast Update Calculation, 236
7.5.3 Channelized Adaptation, 239
7.5.4 Designed Channelization, 240
7.5.5 Modal Decoupling Architecture, 243

7.6 Precision Effects 244
7.6.1 Scaling, 245

7.6.2 Performance Issues, 249
7.6.3 Arithmetic Effects in Fixed Designs, 253
7.6.4 Arithmetic Considerations and Adaptation, 258

7.7 Analog Alternatives 261

7.8 IIR Considerations 263

7.9 Summary 264

8 DESIGN EXAMPLE: HUM REMOVAL FOR AN ELECTROCARDIAGRAM MONITOR 267

8.1 Introduction 267

8.2 Review of the Problem 267

8.3 Design Approach 269

8.4 The Adaptive Noise Canceller (ANC) 271

8.5 Using the Adaptive Noise Canceller to Cancel Echo in Two-wire Telephone Modems 272

8.6 Handling Interference from Multiple Sources 275

9 DESIGN EXAMPLE: MULTIPATH CORRECTION FOR TROPOSCATTER SIGNALS 279

9.1 The Problem 279

9.2 Design Steps 282

9.3 Incorporation of Diversity Combination 288

9.4 The Extension to Bauded Signals 290

9.5 Adaptive Channel Equalization for Terrestrial Digital Microwave Radios 290

9.6 Adaptive Channel Equalization for Voiceband Modems 290

10 DESIGN EXAMPLE: MODELING THE PROPAGATION PATH FOR A DIGITAL TELEVISION SIGNAL 293

10.1 Background 293

10.2 The Basic Approach 295

10.3 A More Advanced Approach 296

10.4 Example 297

10.5 Additional Considerations 301

10.6 Using the Channel Model to Influence the Equalizer's Design 303

10.7 The Difference Between the Filtering Problem and System Identification 305

10.8 Final Comments 307

11 DESIGN EXAMPLE: ENHANCING SIGNAL RECEPTION QUALITY USING AN ARRAY OF ANTENNAS 309

11.1 The Problem 309

11.2 A Simplified Version of the Problem and a Solution 309

11.3 More Complicated Filters to Deal with More Complicated Signals 313
11.3.1 The Adaptive Linear Combiner, 313
11.3.2 Extension to Time and Space, 316

11.4 Adding Adaptivity to Spatial and Spatio-Temporal Processors 317
11.4.1 The Need for Adaptivity, 317
11.4.2 System Level Choices, 318
11.4.3 A Simple Design Example, 319

11.5 Applications and Extensions 322

12 EPILOG 325

APPENDIX A ADAPTIVE FILTERING IN MATLAB 327

A.1 Structural Notes 327

A.2 Examples 329
A.2.1 Figure 8.2: LMS Hum Canceller, 329
A.2.2 Figure 4.5a: Learning Curve for LMS Line Canceller, 331
A.2.3 Figure 4.5b: Learning Curve for RLS Line Canceller, 333

BIBLIOGRAPHY 337
