J D Sanders

TABLE OF CONTENTS

PREFACE	1
Chapter I INTRODUCTION	5
1. Early developments	5
(i) The introduction of alternative resin systems	6
2. Powder types and usage	7
(i) UV-curing powders	11
3. The advantages and disadvantages of powder coatings	11
(i) Advantages	11
(ii) Disadvantages	12
4. The economics of powder usage	13
(i) Material costs	13
(ii) Labour costs	14
(iii) Energy costs	14
(iv) Maintenance	14
(v) Waste disposal	14
5. Markets for powder coatings	15
(i) Markets for decorative coatings	16
(ii) Markets for functional coatings	17

6. The powder manufacturing process	18
(i) Principles involved	18
(a) Premixing	18
(b) Extrusion	19
(c) Fine grinding and particle size reduction	19
(ii) The VAMP process	20
(iii) Agglomeration	21
(iv) Aqueous powder slurry	21
REFERENCES	22

Chapter II RESINS FOR THERMOSETTING POWDER

COATINGS	27
1. Resin parameters	27
(i) Molecular weight	27
(ii) Functionality	28
(iii) Glass transition temperature	28
(iv) Viscosity	28
2. Epoxy resins	29
(i) DGEBA epoxy resins	29
(ii) Manufacture of DGEBA epoxy resins	31
(a) Synthesis of monomeric DGEBA	32
(b) Resin manufacture by the direct process	34
(c) The advancement process	35
(iii) Epoxy-novolac resins	35
(a) The manufacture of epoxy-novolac resins	36
(iv) Modified epoxy resins	37

3. Polyester resins	37
(i) Basic resin chemistry	38
(ii) Resin design	40
(iii) Choice of reactants	41
(iv) Manufacture of polyester resins	47
4. Acrylic resins	49
(i) Choice of monomer and resin design	53
(ii) Manufacture of acrylic resins	55
(a) One-shot process	55
(b) Drip-feed process	56
FURTHER READING	57
REFERENCES	57

Chapter III CURING AGENTS AND CURING REACTIONS ... 63

1. Curing agents for epoxy resins	63
(i) Basic curing agents	64
(a) Lewis bases	64
(b) Secondary amines	65
(c) Primary amines	65
(ii) Established amine curing agents	66
(a) Dicyandiamide-based	66
(i) Accelerated DICY	66
(ii) Substituted DICY	67
(b) Cyclic amidines	67
(i) Low temperature curing amidine derivatives	68

(ii) <i>Low gloss curing amidine derivatives</i>	68
(iii) Acidic curing agents	69
(a) Lewis acids	69
(b) Anhydrides	69
(i) <i>Ring-opening by hydroxyl groups</i>	69
(ii) <i>Ring-opening by Lewis bases</i>	70
(c) Viable anhydride curing agents	71
(d) Organic acids	73
(e) Phenolic compounds	75
2. Curing agents for polyester resins	76
(i) Carboxy-polyester resins	76
(a) Epoxy resins as curing agents	76
(b) Triglycidyl isocyanurate	77
(c) Araldite PT 910	78
(d) β -Hydroxyalkylamide	79
(e) Aliphatic oxirane system	81
(f) Acrylic resins	82
(ii) Hydroxy-polyester resins	84
(a) Blocked isocyanates and uretdiones	84
(b) Melamines	89
(c) Tetramethoxymethyl glycoluril	90
(d) Acid anhydrides	91
(iii) Multi-cured and multi-crosslinked systems	91
(a) Multi-cured systems	93
(b) Multi-crosslinked systems	94
3. Curing agents for acrylic resins	95
(i) Carboxylic acrylic resins	95
(a) Epoxy resins as curing agents	95
(ii) Hydroxy-acrylic resins	96

(iii) Epoxy-functional acrylic resins	96
FURTHER READING	98
REFERENCES	98
 Chapter IV RAW MATERIALS	 105
1. Resins and curing agents	105
2. Pigments	105
(i) The optical properties of pigmented coatings	106
(ii) Colour correction	109
(iii) Pigment evaluation and selection criteria	110
(a) Heat and chemical resistance	111
(b) Stability to extrusion	111
(c) Dispersion	112
(d) Blooming and plate-out	112
(e) Levelling	112
(f) Light and weather fastness	113
(iv) Classification of pigments	113
(v) Inorganic pigments	114
(a) Iron oxide pigments	114
(b) Lead chromate pigments	116
(c) Chromium oxide green pigments	117
(d) Cadmium pigments	117
(e) Ultramarine blue pigments	118
(f) Mixed-phase titanate pigments	119
(g) Mixed-phase metal oxide pigments	120

(vi) Titanium dioxide	123
(a) Performance in powder coatings	124
<i>(i) Ease of processing</i>	124
<i>(ii) Colour</i>	124
<i>(iii) Gloss</i>	124
<i>(iv) Levelling</i>	124
<i>(v) Gelation time and cure</i>	125
<i>(vi) Durability</i>	125
(vii) Carbon black	125
(viii) Organic pigments	126
(a) Organic pigment masterbatches	133
(ix) Metallic and pearlescent pigments	133
(a) Aluminium pigments	133
(b) Bronze pigments	134
(c) Pearlescent pigments	134
3. Fillers and extenders	134
(i) Fillers	135
(ii) Extenders	138
4. Additives	138
(i) Flow agents	139
(ii) Degassing agent	140
(iii) Light stabilisers	140
(iv) Dry flow additives	140
(v) Catalysts	141
(vi) Waxes	142
(a) Polyethylene waxes	142
(b) Polypropylene waxes	142
(c) PTFE-modified waxes	142

FURTHER READING	144
REFERENCES	144
 Chapter V THE FORMULATION OF POWDER COATINGS	 149
1. Epoxy	150
(i) Starting point formulations	150
(a) High gloss finishes	150
(b) Lower gloss finishes	152
(i) <i>Dry blending</i>	153
(ii) <i>Co-extrusion</i>	153
(iii) <i>Fillers</i>	153
(iv) <i>Incompatible components</i>	153
(v) <i>Accelerators</i>	154
(vi) <i>Matt curing agents and competing reactions</i>	154
2. Polyester-epoxy	155
(i) Starting point formulations	157
(a) Lower gloss coatings	158
(ii) Typical coating properties	159
3. Polyester	160
(i) TGIC-cured polyester	161
(a) Starting point formulations	161
(ii) Isocyanate-cured polyester	162
(a) Starting point formulations	164
(iii) Araldite PT 910	165
(iv) β-Hydroxyalkylamide (HAA)	165
(a) Pinholing	165

(b) Yellowing	166
(v) Aliphatic-oxirane system	167
(vi) Tetramethoxymethyl glycoluril (TMMGU)	168
(vii) Formulation of lower gloss polyester finishes	169
(a) Fillers, waxes and accelerators	170
(b) Dry blending	170
(c) Co-extrusion of resin blends	172
(d) Competing curing reactions	173
4. Acrylics	175
REFERENCES	179

Chapter VI FORMULATING FOR SPECIFIC APPLICATIONS AND FINISHES	183
1. Exterior durability	183
(i) Mechanism of degradation	184
(a) Photo-oxidation	184
(b) Hydrolysis	184
(c) Thermal degradation	184
(ii) Superdurable coatings	185
(a) Resin systems	186
(b) Pigmentation	187
(c) Light stabilisers	187
2. Speciality finishes	188
(i) Textures	188
(ii) Structures	189
(iii) Hammers	190

(iv) Wrinkles	191
(v) Metallics	191
(vi) Antiques	192
3. Special applications	192
(i) Powders for tribo application	192
(a) Additives	193
(b) External additives	193
(c) Modification of the polyester resin	193
(ii) Thin-film powders	193
(a) Particle size distribution	193
(b) Binder system	194
(c) Pigmentation	194
(iii) High temperature applications	194
REFERENCES	196

Chapter VII UV-CURING POWDER COATINGS 201

1. Film formation and curing	202
2. UV-curing powder coating chemistry	204
(i) Free radical chemistry	205
(a) Photoinitiators	206
(b) Light stabilisers	209
(c) Pigmentation	210
(d) Coating properties	212
(ii) Cationic cure	214
3. Markets for UV-cured powders	215
(i) Special metal applications	215

(ii) Natural wood	215
(iii) Wood composites	215
(iv) Plastics	216
3. The future for UV-cured powder coatings	216
REFERENCES	217

Chapter VIII FILM FORMATION AND CURE 221

1. Factors controlling film formation	222
(i) Coalescence	224
(ii) Wetting and spreading	226
(iii) Levelling	228
(iv) Cooling	236
2. Viscometry and thermo-viscoelastic measurements	237
(i) Viscometry	238
(ii) Thermo-viscoelastic analysis	241
3. Review of some published TVA results	247
(i) Models of the curing process	254
4. Differential scanning calorimetry	257
(i) Glass transition temperature (T_g).....	258
(ii) Onset of flow (T_{of})	258
(iii) Onset of cure (T_{oc})	258
(iv) T_m and T_c	258
(a) The exothermic peak	258
(b) Reaction kinetics	261
(c) Determination of degree of cure	264
5. Other measurement techniques	264

(i) Dynamic mechanical analysis	264
(ii) Dielectric analysis	265
REFERENCES	266
 Chapter IX TEST METHODS AND PROCEDURES	 273
1. Background	273
2. Terminology	275
3. Test methods for powders	275
(i) Sampling	276
(ii) Powder properties	278
(a) Particle size and particle size distribution	278
(b) Density	280
(i) <i>Density of the powder</i>	281
(ii) <i>Bulk density</i>	282
(c) Powder flow	282
(d) Storage stability	285
(e) Compatibility	286
(iii) Ignition properties	286
(iv) Melt properties	287
(a) Melting point	287
(b) Mass loss on stoving	287
(c) Melt flow	288
(d) Gel time	288
(v) Application properties	289
(a) Deposition efficiency	289
(b) Edge coverage	289

(c) Solvent cure	290
(vi) Electrical properties	290
(a) Resistivity	290
(b) Charge to mass ratio	291
4. Raw materials – resins	293
(i) Acid value	293
(ii) Hydroxyl value	293
(iii) Epoxy content	293
(iv) Melt viscosity	294
(v) Glass transition temperature (T_g)	294
(vi) Resin colour (Gardner)	294
(vi) Resin cleanliness	294
5. Coating properties	294
(i) Exterior durability	296
(ii) Surface profile	297
(iii) Gloss	297
REFERENCES	299

Chapter X COLOUR MEASUREMENT AND MATCHING 303

1. The concept of colour	303
(i) The description of colour	304
(ii) Colour atlases	306
2. The trichromatic and CIE colour measurement system	308
(i) Introduction	308
(ii) Determination of tristimulus values	314
(iii) The 2° and 10° Standard Observer	315

(iv) Standard light sources and illuminants	315
3. Metamerism	316
4. Colour space and colour difference	316
5. Instruments	319
(i) Colorimeters	320
(ii) Spectrophotometers	320
6. Colour matching	321
(i) Visual colour matching	321
(ii) Computer colour matching	323
(a) Kubelka-Munk colour matching theory	323
(b) The pigment database	327
(i) <i>Titanium dioxide</i>	327
(ii) <i>Black pigments</i>	328
(iii) <i>Coloured pigments</i>	328
(c) Using computer colour matching	329
(d) Many-flux colour matching theory	330
(e) The benefits of computer colour matching	330
FURTHER READING	332
REFERENCES	332
 Chapter XI THE FUTURE FOR POWDER COATINGS	 337
1. New markets	337
(i) Automotive topcoats	337
(ii) Heat-sensitive substrates	338
(iii) Coil coating	338

2. Resin and curing agent systems	339
3. Cure	339
4. Manufacture	339
5. Conclusions	340
