

Proteolytic Enzymes

Second Edition

Edited by

Rob Beynon and Judith S. Bond

**PRACTICAL
APPROACH**

Contents

Preface	page v
List of protocols	page xv
Abbreviations	xvii

1 Proteolytic enzymes: nomenclature and classification 1

Alan J. Barrett

1	Introduction	1
2	Terminology and nomenclature	1
	Peptidase and related terms	1
	Specificity-subsite terminology	3
	Catalytic type	3
	Homology	3
3	The EC classification of peptidases	4
	What is the EC system?	4
	What information does the EC list contain?	6
	When and how can a newly-discovered peptidase be added to the EC list?	7
4	The MEROPS system for the classification of peptidases	12
	Families	13
	Clans	17
	Individual peptidases	17
	Uses of the MEROPS system	18
5	Steps one might take on discovering a new peptidase	19
	Acknowledgement	20
	References	20

2 Purification of proteolytic enzymes 23

Sherwin Wilk

1	Introduction	23
2	Prelude to purification	24
	Assay	24
3	Initial considerations	26
	Source	26

Buffer composition	26
Membrane-bound or soluble?	26
Membrane-bound enzymes	27
Endogenous inhibitors and activators	29
4 General scheme for purification of proteolytic enzymes	30
Initial steps	30
Intermediate and final steps	32
5 Specialized techniques for proteolytic enzymes	33
Peptidyl aldehyde affinity chromatography	33
Affinity columns for cysteine proteinases	34
Affinity columns for trypsin-like enzymes	34
Affinity columns for metalloproteinases	35
Other affinity columns	35
6 Optimization of the purification protocol	37
7 Determination of homogeneity	38
8 Purification of the proteasome; EC 3.4.99.46	38
9 Conclusions: many roads lead to Rome	42
References	42

3 Protease assay methods 45

Gautam Sarath, Michael G. Zeece and Alan R. Penheiter

1 Introduction	45
2 Assays with natural substrates	45
Endopeptidase assays	45
Exopeptidase assays	55
3 Assays with synthetic substrates	55
Endopeptidase and aminopeptidase substrates	55
Spectrophotometric assays	56
Fluorimetric assays	59
Miscellaneous fluorimetric methods	62
Carboxypeptidase substrates	64
Radiometric assays	64
HPLC assays for peptidases	65
Capillary electrophoretic analyses of proteases	67
4 Solid-phase protease assays	69
Gel electrophoretic methods	70
Plate assays	73
Miscellaneous solid-phase assays	73
Assays for histochemical studies	74
Acknowledgements	75
References	75

4 Determination of protease mechanism 77

Ben M. Dunn

1 Introduction—the importance of mechanistic classification	77
The serine peptidases	78

- The cysteine peptidases 80
- The aspartic peptidases 81
- The metallopeptidases 81
- 2 Methods for determining the mechanistic class 83
 - Classification based on 'standard' inhibitors 83
 - Chemical modification/identification 86
 - Site-directed mutagenesis 87
 - Mechanistic distinctions—intermediates 88
- 3 Kinetic studies to probe the mechanism in more detail 91
 - Notes on 'ideal' assays 91
 - Kinetic determination of K_m and k_{cat} 92
 - pH dependence of the kinetic parameters 95
 - Solvent deuterium isotope effects 96
 - Transition state analogues and substrate alteration 97
- 4 Determination of primary specificity of a protease 97
 - Degradation of standard proteins and peptides 98
 - Cleavage of homologous synthetic peptides 99
- References 102

5 Inhibition of proteolytic enzymes 105

Guy S. Salvesen and Hideaki Nagase

- 1 Introduction: which inhibitors? 105
- 2 Principles for using irreversible and reversible inhibitors 106
 - General structure of synthetic inhibitors 106
 - How to live with crossreactivity 106
- 3 Practical use of inhibition constants 107
 - Irreversible inhibitors 107
 - Reversible inhibitors 108
- 4 Non-specific inhibitors 109
 - α -Macroglobulins 109
 - Peptide aldehydes 110
 - Peptide chloromethyl ketones 110
 - Metal chelators 111
- 5 Class-specific inhibitors 112
 - Serine proteases 112
 - Cysteine proteases 116
 - Proteasome 119
 - Metalloproteases 120
 - Aspartic proteases 122
- 6 Inhibitors as active-site titrants 122
 - Cysteine proteases 122
 - Serine proteases 124
- 7 Protease inhibitors in cell culture 125
- 8 Suppression of proteolysis 126
- 9 Therapeutic value of protease inhibitors 127
- References 128

6 Finding, purification and characterization of natural protease inhibitors 131

Hideaki Nagase and Guy S. Salvesen

- 1 Introduction 131
 - The meaning of inhibition 131
- 2 Finding protease inhibitors 132
 - Screening of inhibitors from natural sources 132
 - Finding inhibitors by reverse zymography 133
 - Finding inhibitors from DNA sequences 135
 - Combinatorial protease inhibitors 137
- 3 Purification of natural protease inhibitors 137
 - Use of the target enzyme as an affinity ligand 137
 - Conventional purification 137
 - Reverse zymography 138
- 4 Characterization of inhibitors: inhibition kinetics 138
 - The importance of kinetics 138
 - IC₅₀ and percentage inhibition 138
 - Practical inhibitor kinetics 139
 - Reversible inhibitors 140
 - Irreversible inhibitors 143
- 5 Practical applications of protein inhibitors 146
 - Acknowledgements 146
 - References 146

7 Mass spectrometry of proteolysis-derived peptides for protein identification 149

Bernhard Küster, Andrej Shevchenko and Matthias Mann

- 1 Introduction 149
- 2 Mass spectrometry 150
 - Methods of ionization 150
 - Mass analysis 152
 - Tandem mass spectrometry 153
- 3 Interrogation of sequence databases using mass spectrometry data 155
 - Choice of protease 155
 - Peptide mass mapping 157
 - Database identification via tandem mass spectrometry 159
- 4 Analytical strategy for the identification or cloning of proteins using mass spectrometry 161
 - Low-level protein preparation for characterization by mass spectrometry 161
 - Protein visualization 163
 - Proteolytic cleavage of gel separated proteins 165
 - Protein identification by MALDI peptide mass mapping 167
 - Peptide sequencing by nanoelectrospray tandem mass spectrometry 172
 - Towards cloning of proteins using mass spectrometry data 177
- 5 Post-translationally modified proteins 181
- 6 Concluding remarks 183

8 Using proteinases for Edman sequence analysis and peptide marking 187

John Shannon

- 1 Introduction 187
 - The need for digesting proteins to peptides 187
- 2 Substrate preparation 188
 - Purification techniques 188
 - Sample requirements 189
 - Reduction and alkylation of proteins 191
3. Digestion 193
 - Choice of proteinase 193
 - Conditions for proteolytic digestions 196
 - Digestion of proteins isolated on polyacrylamide gels 199
 - Monitoring a reaction 200
4. Analysis of the proteolytic digestion 200
 - Mass spectrometry 200
 - Electrophoresis 200
 - Ion exchange 200
 - Reverse-phase chromatography 201
 - Data interpretation 209

Acknowledgments 209

9 Prevention of unwanted proteolysis 211

Michael J. North and Robert J. Beynon

- 1 Introduction 211
- 2 Proteolytic susceptibility of native proteins 213
 - Intrinsic factors determining the susceptibility of proteins to proteolysis 213
 - The influence of other molecules on susceptibility to proteolysis 213
 - Properties of endogenous proteinases 214
- 3 Identification of proteolysis as a problem 214
 - Changes in protein properties 214
 - Mimicking an effect with added proteinases 216
 - Checking samples for proteinase activity 216
- 4 Inhibition of proteinases 217
 - Outline of approaches for reducing proteinase activity 217
 - Suppression of endogenous proteinase activity 217
 - Preventing proteolysis by denaturation 217
 - Use of proteinase inhibitors 220
- 5 Removal of proteinases 227
 - Choice of starting material 227
 - Cell disruption and fractionation 230
 - Selective removal of proteinases during purification 231

Acknowledgements 231

10 Proteolysis of native proteins as a structural probe 233

Simon Hubbard and Robert J. Beynon

- 1 Introduction 233
 - 2 Factors influencing susceptibility 235
 - Molecular recognition and limited proteolysis 235
 - Prediction of nicksites 236
 - A tool to aid in prediction of sites of limited proteolysis 239
 - 3 Experimental considerations 240
 - Choice of proteinase 242
 - Ratio of proteinase to substrate 245
 - Solution conditions 245
 - Determination of site of proteolysis 246
 - Strategies for limited proteolysis experiments 247
 - 4 Analysis of limited proteolysis data and simulations 249
 - Obtaining quantitative data 250
 - Analysing the data by non-linear curve fitting 254
 - Example reaction schemes 257
 - Simulations and modelling 258
- References 264

11 Proteases in peptide synthesis 265

Volker Kasche

- 1 Introduction 265
- 2 Enzyme properties influencing the product yield and steric purity in protease catalysed peptide synthesis 267
 - Kinetically controlled synthesis 267
 - Equilibrium-controlled peptide synthesis 270
- 3 Selecting the optimal protease 271
 - Purity of the protease 271
 - P_1 and P_1' specificity 272
- 4 Factors controlling the yield and steric purity in the synthesis of a peptide bond with a given enzyme 278
 - Protection of the P_1' and activation of the P_1 -carboxyl group 279
 - pH 279
 - Temperature 281
 - Ionic strength 282
 - Solvent composition 283
 - Peptide synthesis in suspensions with solid product or substrate 284
- 5 Planning a protease-catalysed synthesis of a peptide bond 286
 - What enzyme? 286
 - Equilibrium-controlled or kinetically controlled synthesis? 287
 - Free or immobilized enzyme? 287
- 6 Experimental methods for protease-catalysed peptide synthesis 288
 - Enzyme purity and purification 288
 - Enzyme immobilization 288
 - Substrates and buffers 288
 - Monitoring the synthesis; purification of products 289
 - Optimizing the yield 289
