|                                                                 |            |
|-----------------------------------------------------------------|------------|
| <b>Preface</b>                                                  | <b>xi</b>  |
| <b>Acknowledgments</b>                                          | <b>xix</b> |
| <b>0 Inner Product Spaces</b>                                   | <b>1</b>   |
| 0.1 Motivation . . . . .                                        | 1          |
| 0.2 Definition of Inner Product . . . . .                       | 1          |
| 0.3 The Spaces $L^2$ and $l^2$ . . . . .                        | 4          |
| 0.3.1 Definitions . . . . .                                     | 4          |
| 0.3.2 Convergence in $L^2$ versus Uniform Convergence . . . . . | 7          |
| 0.4 Schwarz and Triangle Inequalities . . . . .                 | 10         |
| 0.5 Orthogonality . . . . .                                     | 12         |
| 0.5.1 Definitions and Examples . . . . .                        | 12         |
| 0.5.2 Orthogonal Projections . . . . .                          | 14         |
| 0.5.3 Gram-Schmidt Orthogonalization . . . . .                  | 19         |
| 0.6 Linear Operators and Their Adjoints . . . . .               | 20         |
| 0.6.1 Linear Operators . . . . .                                | 20         |
| 0.6.2 Adjoints . . . . .                                        | 21         |
| 0.7 Least Squares and Linear Predictive Coding . . . . .        | 23         |
| 0.7.1 Best Fit Line for Data . . . . .                          | 23         |
| 0.7.2 General Least Squares Algorithm . . . . .                 | 27         |
| 0.7.3 Linear Predictive Coding . . . . .                        | 29         |
| 0.8 Exercises . . . . .                                         | 32         |
| <b>1 Fourier Series</b>                                         | <b>37</b>  |
| 1.1 Introduction . . . . .                                      | 37         |
| 1.1.1 Historical Perspective . . . . .                          | 37         |
| 1.1.2 Signal Analysis . . . . .                                 | 38         |
| 1.1.3 Partial Differential Equations . . . . .                  | 39         |

|          |                                                                             |            |
|----------|-----------------------------------------------------------------------------|------------|
| 1.2      | Computation of Fourier Series . . . . .                                     | 41         |
| 1.2.1    | On the Interval $-\pi \leq x \leq \pi$ . . . . .                            | 41         |
| 1.2.2    | Other Intervals . . . . .                                                   | 43         |
| 1.2.3    | Cosine and Sine Expansions . . . . .                                        | 45         |
| 1.2.4    | Examples . . . . .                                                          | 49         |
| 1.2.5    | The Complex Form of Fourier Series . . . . .                                | 57         |
| 1.3      | Convergence Theorems for Fourier Series . . . . .                           | 61         |
| 1.3.1    | The Riemann-Lebesgue Lemma . . . . .                                        | 61         |
| 1.3.2    | Convergence at a Point of Continuity . . . . .                              | 63         |
| 1.3.3    | Convergence at a Point of Discontinuity . . . . .                           | 67         |
| 1.3.4    | Uniform Convergence . . . . .                                               | 72         |
| 1.3.5    | Convergence in the Mean . . . . .                                           | 75         |
| 1.4      | Exercises . . . . .                                                         | 82         |
| <b>2</b> | <b>The Fourier Transform</b> . . . . .                                      | <b>91</b>  |
| 2.1      | Informal Development of the Fourier Transform . . . . .                     | 91         |
| 2.1.1    | The Fourier Inversion Theorem . . . . .                                     | 91         |
| 2.1.2    | Examples . . . . .                                                          | 94         |
| 2.2      | Properties of the Fourier Transform . . . . .                               | 98         |
| 2.2.1    | Basic Properties . . . . .                                                  | 98         |
| 2.2.2    | Fourier Transform of a Convolution . . . . .                                | 104        |
| 2.2.3    | Adjoint of the Fourier Transform . . . . .                                  | 107        |
| 2.2.4    | Plancherel Formula . . . . .                                                | 107        |
| 2.3      | Linear Filters . . . . .                                                    | 108        |
| 2.3.1    | Time Invariant Filters . . . . .                                            | 108        |
| 2.3.2    | Causality and the Design of Filters . . . . .                               | 113        |
| 2.4      | The Sampling Theorem . . . . .                                              | 117        |
| 2.5      | The Uncertainty Principle . . . . .                                         | 120        |
| 2.6      | Exercises . . . . .                                                         | 125        |
| <b>3</b> | <b>Discrete Fourier Analysis</b> . . . . .                                  | <b>131</b> |
| 3.1      | The Discrete Fourier Transform . . . . .                                    | 131        |
| 3.1.1    | Definition of Discrete Fourier Transform . . . . .                          | 133        |
| 3.1.2    | Properties of the Discrete Fourier Transform . . . . .                      | 134        |
| 3.1.3    | The Fast Fourier Transform . . . . .                                        | 136        |
| 3.1.4    | The FFT Approximation to the Fourier Transform . . . . .                    | 142        |
| 3.1.5    | Application—Parameter Identification . . . . .                              | 143        |
| 3.1.6    | Application—Discretizations of Ordinary<br>Differential Equations . . . . . | 144        |
| 3.2      | Discrete Signals . . . . .                                                  | 145        |
| 3.2.1    | Time Invariant, Discrete Linear Filters . . . . .                           | 145        |
| 3.2.2    | Z-Transform and Transfer Functions . . . . .                                | 147        |
| 3.3      | Exercises . . . . .                                                         | 151        |

|          |                                                                   |            |
|----------|-------------------------------------------------------------------|------------|
| <b>4</b> | <b>Haar Wavelet Analysis</b>                                      | <b>155</b> |
| 4.1      | Why Wavelets?                                                     | 155        |
| 4.2      | Haar Wavelets                                                     | 156        |
| 4.2.1    | The Haar Scaling Function                                         | 156        |
| 4.2.2    | Basic Properties of the Haar Scaling Function                     | 157        |
| 4.2.3    | Basic Properties of the Haar Scaling Function                     | 161        |
| 4.2.4    | The Haar Wavelet                                                  | 162        |
| 4.3      | Haar Decomposition and Reconstruction Algorithms                  | 166        |
| 4.3.1    | Decomposition                                                     | 166        |
| 4.3.2    | Reconstruction                                                    | 170        |
| 4.3.3    | Filters and Diagrams                                              | 177        |
| 4.4      | Summary                                                           | 178        |
| 4.5      | Exercises                                                         | 180        |
| <b>5</b> | <b>Multiresolution Analysis</b>                                   | <b>183</b> |
| 5.1      | The Multiresolution Framework                                     | 183        |
| 5.1.1    | Definition                                                        | 183        |
| 5.1.2    | The Scaling Relation                                              | 187        |
| 5.1.3    | The Associated Wavelet and Wavelet Spaces                         | 190        |
| 5.1.4    | Decomposition and Reconstruction Formulas:<br>A Tale of Two Bases | 193        |
| 5.1.5    | Summary                                                           | 195        |
| 5.2      | Implementing Decomposition and Reconstruction                     | 196        |
| 5.2.1    | The Decomposition Algorithm                                       | 197        |
| 5.2.2    | The Reconstruction Algorithm                                      | 201        |
| 5.2.3    | Processing a Signal                                               | 205        |
| 5.3      | Fourier Transform Criteria                                        | 208        |
| 5.3.1    | The Scaling Function                                              | 208        |
| 5.3.2    | Orthogonality via the Fourier Transform                           | 210        |
| 5.3.3    | The Scaling Equation via the Fourier Transform                    | 213        |
| 5.3.4    | Iterative Procedure for Constructing the<br>Scaling Function      | 217        |
| 5.4      | Exercises                                                         | 221        |
| <b>6</b> | <b>The Daubechies Wavelets</b>                                    | <b>227</b> |
| 6.1      | Daubechies's Construction                                         | 227        |
| 6.2      | Classification, Moments, and Smoothness                           | 231        |
| 6.3      | Computational Issues                                              | 235        |
| 6.4      | The Scaling Function at Dyadic Points                             | 236        |
| 6.5      | Exercises                                                         | 239        |
| <b>7</b> | <b>Other Wavelet Topics</b>                                       | <b>243</b> |
| 7.1      | Computational Complexity                                          | 243        |
| 7.1.1    | Wavelet Algorithm                                                 | 243        |
| 7.1.2    | Wavelet Packets                                                   | 244        |
| 7.2      | Wavelets in Higher Dimensions                                     | 245        |

|                     |                                                               |            |
|---------------------|---------------------------------------------------------------|------------|
| 7.3                 | Relating Decomposition and Reconstruction . . . . .           | 247        |
| 7.3.1               | Transfer Function Interpretation . . . . .                    | 251        |
| 7.4                 | Wavelet Transform . . . . .                                   | 253        |
| 7.4.1               | Definition of the Wavelet Transform . . . . .                 | 254        |
| 7.4.2               | Inversion Formula for the Wavelet Transform . . . . .         | 255        |
| <b>Appendix A</b>   | <b>Technical Matters</b>                                      | <b>261</b> |
| A.1                 | Proof of the Fourier Inversion Formula . . . . .              | 261        |
| A.2                 | Rigorous Proof of Theorem 5.17 . . . . .                      | 264        |
| A.2.1               | Proof of Theorem 5.10 . . . . .                               | 268        |
| A.2.2               | Proof of the Convergence Part of Theorem 5.23 . . . . .       | 270        |
