

HISTOLOGY and CELL BIOLOGY

An Introduction to Pathology

Abraham L. Kierszenbaum, MD, PhD

 Mosby

1	PART I BASIC TISSUES AND INTEGRATED CELL BIOLOGY
3	Chapter 1 EPITHELIUM
3	Classification
7	Epithelial cell polarity
9	Cell adhesion molecules and cell junctions
13	Cell junctions
18	Clinical significance: Connexin mutations in human disease
19	Laminin, fibronectin, and the basement membrane
21	Cell-cell interactions
23	The cytoskeleton
24	Microfilaments
26	Microtubules
27	Microtubules in cilia and flagella
29	Clinical significance: Microtubules, treatment of cancer, and sterility
29	Motor proteins
	The transport of organelles along microtubules: Axonal transport
30	The myosin family associates with actin to form contractile structures
31	Actin-myosin contraction assemblies in nonmuscle cells
32	Intermediate filaments
35	Hemidesmosomes and intermediate filaments
35	Clinical significance: Intermediate filaments and blistering diseases
35	The cell nucleus
37	Dosage compensation: Inactivation of one of the X chromosomes
38	The nucleolus
40	Localization of nucleic acids
40	The cell cycle
42	Control of the cell cycle by cyclins and cyclin-dependent protein kinases
43	Analysis of the dynamics of the cell cycle: Autoradiography and FACS
44	Breakdown and reassembly of the nuclear envelope
45	Tumor suppressor genes
46	Clinical significance: Retinoblastoma gene and other suppressor genes
47	Mitosis
47	Telomerase, senescence, and tumor growth
48	Chemotherapy and drug resistance
50	Karyotyping
51	Chapter 2 EPITHELIAL GLANDS
51	Development of epithelial glands
51	Classification of epithelial glands
53	The secretory portion can be unicellular or multicellular
54	The shape of the secretory portion
55	The type of secretion
55	The mechanism of secretion
56	Cytomembranes: The plasma membrane
56	The phospholipid bilayer
57	Membrane proteins
58	Difference between a surface and a face in freeze-fracturing
59	The internal environment of the cell
61	The endoplasmic reticulum
61	The rough endoplasmic reticulum and protein synthesis and sorting
63	The Golgi apparatus and the protein sorting pathways

- 68 Lysosomes
- 69 Receptor-mediated endocytosis: The uptake of cholesterol
- 71 Clinical significance: Familial hypercholesterolemia. Lysosomal storage disorders
- 71 Vesicular transport
- 73 Vesicle fusion to a target membrane
- 73 Mitochondria
- 75 Clinical significance: Mitochondrial inheritance
- 75 Peroxisomes
- 75 Clinical significance: Zellweger syndrome

77 **Chapter 3 CELL SIGNALING**

- 77 Cell signaling mechanisms
- 77 Mechanisms of action of cell signaling molecules
- 79 Nitric oxide
- 79 Cell signaling molecules binding to cell surface receptors
- 80 Pathways of intracellular signaling by cell surface receptors
- 81 Major pathways of intracellular cell signaling
- 82 The cAMP pathway
- 83 The cGMP pathway
- 83 The phospholipase C-Ca²⁺ pathway
- 85 The NF-κB transcription factor pathway
- 85 The Ca²⁺-calmodulin pathway
- 86 The MAP kinase pathway
- 86 The JAK-STAT pathway
- 87 Stem cells, a multipotent cell population
- 88 In vitro cell proliferation, senescence, and telomerase
- 90 Apoptosis or programmed cell death
- 91 Three major cellular mechanisms are involved in proteolysis
- 92 Proto-oncogenes and oncogenes

95 **Chapter 4 CONNECTIVE TISSUE**

- 95 Classification
- 98 Cell components of the connective tissue
- 98 Synthesis, secretion, and assembly of collagen
- 101 Clinical significance: Ehlers-Danlos syndrome
- 101 Synthesis, secretion, and assembly of elastic fibers
- 101 Clinical significance: Marfan syndrome
- 103 The macrophage
- 103 The mast cell
- 104 The plasma cell
- 106 The extracellular matrix
- 108 Degradation of the extracellular matrix
- 108 Clinical significance: Molecular biology of tumor invasion
- 111 Adipose tissue or fat
- 112 Clinical significance: Obesity
- 113 Cartilage
- 116 Growth of cartilage (chondrogenesis)
- 116 Types of cartilage
- 118 Bone
- 121 Classification of bone
- 123 The periosteum and endosteum
- 123 The bone matrix
- 126 Cellular components of bone
- 126 Osteoblasts and osteocytes
- 126 Clinical significance: Osteoblast differentiation
- 128 Osteoclasts
- 128 Regulation of osteoclast differentiation
- 129 Clinical significance: Osteoporosis and osteomalacia

131 **Chapter 5 OSTEOGENESIS**

- 131 Bone formation (osteogenesis or ossification)
- 131 Intramembranous bone formation
- 133 Endochondral ossification

- 136 Secondary centers of ossification and the epiphyseal growth plate
 138 Clinical significance: The epiphyseal growth plate and dwarfism
 139 Zones of endochondral ossification
 141 Growth in width of the diaphysis
 142 Clinical significance: Osteopetrosis, rickets, and fibrodysplasia
 ossificans progressiva
 143 Joints
 144 Clinical significance: Rheumatoid arthritis
- Chapter 6 BLOOD AND HEMATOPOIESIS**
- 147 Blood
 147 Plasma
 147 Cellular elements of the blood
 Red blood cells (erythrocytes)
 148 Clinical significance: Cytoskeletal and hemoglobin abnormalities
 149 Clinical significance: Erythroblastosis fetalis
 150 Leukocytes
 151 Granulocytes
 153 Agranulocytes
 154 Clinical significance: Leukocytes migrate to the sites of infection by
 the homing process
 155 Clinical significance: Mast cell–eosinophil interaction in asthma
 155 Platelets
 156 Clinical significance: Thrombocytopenia
 157 Clinical significance: Hemostasis and the blood clotting cascade
 157 Hematopoiesis
 Sites of hematopoiesis during development
 163 Hematopoietic cell populations: Stem, committed, and maturing
 cells
 163 Clinical significance: Hematopoietic growth factors
 163 The erythroid lineage
 164 Leukopoiesis: Granulocytes and agranulocytes
 165 Granulocytes
 167 Agranulocytes
 167 Lymphocytes
 170 Monocytes
 171 Clinical significance: Colony-stimulating factors and interleukins
 172 Platelets and megakaryocytes
 174 Clinical significance: Thrombopoietin
 174 Clinical significance: Stem cell factor (also known as *c-kit* ligand)
 174 Clinical significance: Transferrin and iron metabolites
- Chapter 7 MUSCLE TISSUE**
- 177 Skeletal muscle
 177 Characteristics of the skeletal muscle cell or fiber
 178 The myofibril is a repeat of sarcomere units
 179 Components of the thin and thick filaments of the sarcomere
 182 Mechanism of muscle contraction: Actin and myosin filaments
 slide past each other
 183 The neuromuscular junction
 184 Clinical significance: Disorders of neuromuscular transmission
 185 A depolarization signal travels inside the muscle by T tubules
 186 Calcium controls muscle contraction
 187 Clinical significance: Muscular dystrophies
 189 Clinical significance: Satellite cells and muscle regeneration
 192 The neuromuscular spindle
 192 Types of skeletal muscle fibers
 192 Cardiac muscle
 195 Clinical significance: Transport proteins on the sarcolemma of
 cardiocytes
 196 Clinical significance: Myocardial infarction
 196 Smooth muscle
 197 Mechanism of smooth muscle contraction

199	Chapter 8 NERVOUS TISSUE
199	General organization of the nervous system
199	Development of the nervous system
200	Cell types: Neurons and glia
	The neuron
201	Types of neurons
202	Designation of groups of neurons and axons
203	Synaptic terminals and synapses
204	Clinical significance: Axonal transport of rabies virus
206	Glia, the "connective tissue" of the CNS
207	Oligodendrocytes and Schwann cells: Myelination
209	Myelin: Protein and lipid components
210	Clinical significance: Myelin and multiple sclerosis
212	Microglial cells
213	Ependyma and choroid plexus
	Ependyma
213	Choroid plexus
214	The cerebrospinal fluid
214	Peripheral nervous system
214	Structure of a peripheral nerve
216	Clinical significance: Segmental demyelination and axonal degeneration
221	Clinical significance: Neurodegenerative diseases
222	Sensory ganglia
225	Autonomic (sympathetic and parasympathetic) ganglia
225	Neurohistologic methods
227	Chapter 9 SENSORY ORGANS: VISION AND HEARING
227	The eye
228	The development of the eye
228	The outer tunic of the eye
	The sclera
228	The cornea
232	The middle tunic of the eye
	The uvea
235	The three chambers of the eye
236	The lens
237	Clinical significance: Cataracts
238	Accommodation
239	The inner layer of the eye: The retina
240	Clinical significance: Detachment of the retina
242	The cell layers of the retina
242	Photoreceptor neurons: Rods and cones
245	Conducting neurons: Bipolar and ganglion cells
246	Association neurons: Horizontal and amacrine cells
247	Supporting glial cells: Müller cells
248	The eyelids, conjunctiva, and the lacrimal gland
250	Clinical significance: The red eye
250	The ear
251	The external ear
252	The middle ear
254	The development of the inner ear
254	The inner ear
256	The vestibular organ
257	The semicircular canals
260	Clinical significance: Ménière's disease
260	The otolithic organs
260	The cochlea
263	The hearing process
263	Clinical significance: Deafness and balance

265	PART II ORGAN SYSTEMS: PROTECTION OF THE BODY
267	Chapter 10 IMMUNE-LYMPHATIC SYSTEM
267	Organization of the immune-lymphatic system
268	Innate (natural) and adaptive (acquired) immunity
269	Properties of adaptive or acquired immunity
270	The development of B cells
271	The major histocompatibility complex and human leukocyte antigens
271	The T cell receptor complex
272	CD4 and CD8 coreceptors
273	MHC molecules and adaptive immune responses
273	T cells developing in the thymus express specific cell surface molecules
274	T cell-mediated immunity
275	How do helper T cells help?
276	How do cytolytic T cells kill?
276	Players in the immune responses: Regulatory and effector cells
277	Clinical significance: Acquired immunodeficiency syndrome
279	Clinical significance: Allergy
279	The complement system
282	Lymphoid organs
282	Lymph nodes
282	Structure of a lymph node
285	Clinical significance: Strategic distribution of B and T cells in the cortex
286	Thymus
286	The development of the thymus
289	Structure of the thymus
290	Spleen
291	White pulp
293	Red pulp
295	Clinical significance: Sickle cell disease
296	Clinical significance: The homing process during inflammation
298	Clinical significance: Adoptive cellular immunotherapy
299	Chapter 11 INTEGUMENTARY SYSTEM
299	Skin types and general organization
299	Epidermis
300	Clinical significance: Wound repair and psoriasis
301	Differentiation of a keratinocyte
303	Melanocytes
304	Langerhans cells (dendritic cells)
305	Merkel cells
305	Dermis
307	Blood supply
308	Sensory receptors
309	Hypodermis
310	Skin appendages: Hairs, glands, and fingernails
310	Hairs
313	Clinical significance: Keratinocyte stem cells and the hair follicle
313	Glands
314	Sweat glands
316	Clinical significance: Sweat glands and cystic fibrosis
317	Fingernails
319	PART III ORGAN SYSTEMS: BLOOD CIRCULATORY SYSTEMS
321	Chapter 12 CARDIOVASCULAR SYSTEM
321	General characteristics of the cardiovascular system
321	Heart
322	The conductive system of the heart
323	Differences between cardiac muscle fibers and Purkinje fibers
324	Arteries
325	Large elastic arteries are conducting vessels

- 325 Clinical significance: Aortic aneurysms
- 326 Medium-sized muscular arteries are distributing vessels
- 326 Arterioles are resistance vessels
- 327 Capillaries are exchange vessels
- 330 Three types of capillaries: Continuous, fenestrated, and discontinuous
- 331 Veins are capacitance or reservoir vessels
- 332 Lymphatic vessels
- 333 Clinical significance: Edema
- 333 Special capillary arrangements: Glomerulus and portal systems
- 333 Endothelial cell-mediated regulation of blood flow
- 334 Clinical significance: Arterial diseases
- 337 Vascular morphogenesis: Vascular endothelial growth factor and angiopoietins
- 338 Clinical significance: Tumor angiogenesis

339 **Chapter 13 RESPIRATORY SYSTEM**

- 339 General outline of the respiratory system
- 339 Nasal cavities and paranasal sinuses
- 340 Nasopharynx
- 340 The olfactory epithelium
- 343 The larynx
- 343 The trachea
- 347 Intrapulmonary segmentation of the bronchial tree
- 348 The pulmonary lobule and acinus
- 349 Clinical significance: Chronic obstructive pulmonary disease
- 354 Nonciliated Clara cells in terminal bronchioles secrete surfactant
- 354 Clinical significance: Cystic fibrosis
- 358 The respiratory portion of the lung
- 359 The alveolus is the functional unit of the pulmonary acinus
- 360 Type II alveolar cells secrete pulmonary surfactant
- 362 Clinical significance: Acute respiratory distress syndrome
- 362 The pleura
- 362 Clinical significance: Disorders of the pleura

365 **Chapter 14 URINARY SYSTEM**

- 365 The kidney
- 365 The organization of the renal vascular system
- 367 The vasa recta
- 368 Difference between lobe and lobule
- 369 The uriniferous tubule consists of a nephron and a collecting duct
- 370 The nephron
- 370 The renal corpuscle is the filtering unit
- 373 Clinical significance of the glomerular filtration barrier: Alport's syndrome and the congenital nephrotic syndrome
- 373 The mesangium
- 375 Clinical significance of the glomerulus: Glomerular diseases
- 376 The juxtaglomerular apparatus
- 376 Proximal convoluted tubule: The reabsorption component
- 381 Loop of Henle
- 383 Distal convoluted tubule
- 384 Collecting tubule (duct)
- 384 The renin-angiotensin-aldosterone system
- 386 The excretory passages of urine
- 387 Countercurrent multiplier
- 390 Clinical significance: Mechanism of action of diuretics

391 **PART IV ORGAN SYSTEMS: ALIMENTARY SYSTEM**

393 **Chapter 15 UPPER DIGESTIVE SEGMENT**

- 393 General outline of the digestive or alimentary tube
- 393 The upper digestive segment: Mouth, esophagus, and stomach
- 393 The mouth
- 394 The tongue

- 395 The tooth
 397 Tooth development and the differentiation of ameloblasts and odontoblasts
 399 Odontoblasts
 401 Cementum
 401 Ameloblasts
 401 General organization of the digestive or alimentary tube
 403 Microvasculature of the digestive tube
 404 Clinical significance: Gastric microcirculation and gastric ulcers
 405 Nerve supply of the digestive tube
 406 The esophagus
 408 Clinical significance: The mechanism of swallowing and dysphagia
 409 The stomach
 412 Cardiac region
 412 Fundus-body region: The gastric gland
 413 Secretion of hydrochloric acid by parietal cells
 414 Clinical significance: The gastric mucosal barrier and *Helicobacter pylori* infection
 417 Gastroenteroendocrine cells
 419 Clinical significance: Zollinger-Ellison syndrome
 419 Pyloric glands
 419 The mucosa, submucosa, and muscularis of the stomach
- Chapter 16 LOWER DIGESTIVE SEGMENT**
 421 Small intestine
 421 The intestinal wall
 424 Microcirculation of the small intestine
 424 Innervation and motility of the small intestine
 426 Histologic differences of the duodenum, jejunum, and ileum
 427 The villus and crypts of Lieberkühn
 427 Absorptive cells, or enterocytes
 429 Goblet cells
 430 Enteroendocrine cells
 430 The protection of the small intestine
 431 Peyer's patches
 432 Clinical significance: Targeting mucosal vaccine vectors to M cells
 433 Plasma cells and secretory IgA dimer
 434 The Paneth cell
 435 Clinical significance: Inflammatory bowel disease and the enteric bacterial microflora
 437 Clinical significance: Malabsorption syndromes
 439 Large intestine
 443 Clinical significance: Hirschsprung's disease (congenital megacolon)
 444 Clinical significance: Familial polyposis gene and colorectal carcinogenesis
- Chapter 17 DIGESTIVE GLANDS**
 448 The branching duct system of a salivary gland
 448 Saliva is the major product of salivary glands
 448 The parotid gland
 450 Clinical significance: Mumps, rabies, and tumors
 450 Submandibular (submaxillary) gland
 451 Sublingual gland
 453 Exocrine pancreas
 454 Clinical significance: Carcinoma of the pancreas
 455 The pancreatic acinus
 457 Clinical significance: Acute pancreatitis and cystic fibrosis
 459 Liver
 460 The hepatic lobule
 461 A functional view of the liver lobule
 464 The hepatocyte

465	Peroxisomes
466	Clinical significance: Liver storage diseases
466	Clinical significance: Alcoholism and fatty liver (alcoholic steatohepatitis)
467	Clinical significance of the hepatic stellate cell
468	The bile: Mechanism of secretion
471	Metabolism of bilirubin
472	Composition of the bile
474	Clinical significance: Pathologic conditions affecting bile secretion
474	Clinical significance: Hyperbilirubinemia
474	The gallbladder
475	PART V ORGAN SYSTEMS: ENDOCRINE SYSTEM
477	Chapter 18 NEUROENDOCRINE SYSTEM
477	Highlights of the hypothalamohypophysial system
477	The hypophysis
477	Embryologic origin of the hypophysis
478	Blood supply of the hypophysis: The hypothalamohypophysial portal circulation
479	Histology of the pars distalis (anterior lobe)
481	Hormones secreted by acidophils: Growth hormone and prolactin
482	Growth hormone
484	Clinical significance: Gigantism (in children) and acromegaly (in adults)
484	Prolactin
484	Clinical significance: Hyperprolactinemia
484	Hormones secreted by basophils: Gonadotropins, TSH, and ACTH
485	Gonadotropins: FSH and LH
485	Clinical significance: Infertility
486	Thyroid-stimulating hormone
486	Clinical significance: Hypothyroidism
486	ACTH
488	Clinical significance: Cushing's disease
488	The neurohypophysis
490	Clinical significance: Diabetes insipidus
493	The pineal gland
493	Development of the pineal gland
494	Histology of the pineal gland
496	The pineal gland secretes melatonin, the "hormone of darkness"
496	The circadian clock
497	Clinical significance: Precocious puberty
499	Chapter 19 ENDOCRINE SYSTEM
499	The thyroid gland
499	Development of the thyroid gland
499	Histologic organization of the thyroid gland
499	Function of the thyroid gland
504	Clinical significance: Hyperthyroidism (Graves' disease) and hypothyroidism
504	Calcium regulation
505	The parathyroid glands
505	Development of the parathyroid glands
506	Histologic organization of the parathyroid glands
507	Function of the parathyroid hormone
507	Clinical significance: Hyperparathyroidism and hypoparathyroidism
509	C cells (thyroid follicle)
509	Calcitonin
509	Clinical significance: Multiple endocrine neoplasia syndrome
509	Vitamin D
509	Clinical significance: Rickets and osteomalacia
510	The adrenal gland

- 510 Histologic organization of the adrenal cortex
- 516 The adrenal medulla
- 518 Actions of catecholamines are mediated by adrenergic receptors α and β
- 518 Blood supply to the adrenal gland
- 519 Clinical significance: Abnormal secretory activity of the adrenal cortex
- 519 Clinical significance: Hypersecretory activity of the adrenal medulla
- 519 Development of the adrenal gland
- 520 Clinical significance: Congenital adrenal hyperplasia
- 520 Functions of the fetal adrenal cortex
- 520 Endocrine pancreas
- 520 Development of the pancreas
- 521 Histology of the islet of Langerhans
- 526 Clinical significance: Insulin and diabetes

529 PART VI ORGAN SYSTEMS: REPRODUCTIVE SYSTEM

531 Chapter 20 SPERMATOGENESIS

- 531 The testes
- 531 The seminiferous epithelium
- 531 Sertoli cells
- 535 Spermatogonia
- 537 Spermatocytes
- 538 Meiosis
- 539 Spermatids
- 542 Events at the completion of spermiogenesis
- 544 Structure of the sperm
- 544 Clinical significance: Pathologic conditions affecting spermatogenesis
- 544 Temperature
- 544 Cryptorchidism
- 545 Cancer chemotherapy
- 545 Mumps
- 545 Spermatic cord torsion
- 545 Varicocele
- 545 Leydig cells
- 546 Clinical significance: Steroidogenic acute regulatory protein
- 548 Hormonal control of the male reproductive tract
- 550 The spermatogenic cycle

551 Chapter 21 SPERM TRANSPORT AND MATURATION

- 551 The development of the testis
- 552 Testis-determining factor controls the development of the testis
- 552 The development of male and female internal genitalia: Role of müllerian-inhibiting substance and testosterone
- 553 Testicular descent
- 553 Clinical significance: Genetic abnormalities of the male reproductive tract
- 554 The sperm maturation pathway
- 557 Accessory genital glands
- 557 Seminal vesicles
- 558 Prostate gland
- 559 Clinical significance: Benign prostatic hyperplasia and prostate cancer
- 561 The male and female urethra
- 563 Bulbourethral glands
- 563 The penis
- 564 Clinical significance: Erectile dysfunction

565 Chapter 22 FOLLICLE DEVELOPMENT AND MENSTRUAL CYCLE

- 565 Development of the female reproductive tract
- 565 Development of the ovary

566	Development of the female genital ducts
566	Development of the external genitalia
566	Clinical significance: Developmental anomalies of the female genital tract
566	Clinical significance: Developmental anomalies of the ovary: Turner's syndrome
566	The ovary
567	The ovarian cycle
571	Follicular atresia or degeneration
572	The ovulatory phase
572	The luteal phase: The corpus luteum
572	Hormonal regulation of ovulation and the corpus luteum
575	Oviduct, fallopian or uterine tube
578	Uterus
580	Vascularization of the endometrium and menstruation
581	Cervix
583	Vagina
583	Clinical significance: Cervical intraepithelial neoplasia
583	Mons pubis, labia majora, and labia minora
584	Urethral meatus and glands (paraurethral glands and Bartholin's glands)
585	Chapter 23 FERTILIZATION, PLACENTATION, AND LACTATION
585	The fertilization process
585	The zona pellucida
588	Placentation
589	Implantation of the blastocyst
591	Formation of primary, secondary, and tertiary villi
592	Histologic features of the placenta
594	Maternal and fetal components
596	Structure of the mature chorionic villus
597	Clinical significance: Disorders of the placenta
597	Ectopic pregnancy
598	Placenta previa (second half of pregnancy)
598	Placental abruption, or abruptio placentae (second half of pregnancy)
599	Uterine atony
600	Placenta accreta
600	Clinical significance: Gestational trophoblastic disease
600	Clinical significance: Functions of the placenta
601	Lactation
601	The mammary gland
601	Structure of the mammary gland
602	Development of the mammary gland
605	Suckling during lactation
606	Clinical significance: Androgen insensitivity syndrome
606	Clinical significance: Benign breast diseases and breast cancer
609	SUBJECT INDEX
