<b>Preface</b>	xi
<b>Acknowledgements</b>	xiii
<b>Illustration acknowledgements</b>	xiv
<b>1 The process of evolution: natural selection</b>	<b>1</b>
1.1 What was Darwin's theory of natural selection?	1
1.2 What was Mendel's theory of heredity?	2
1.3 What is the cellular basis of heredity?	4
1.4 What is the origin of genetic variation?	6
1.5 What is the nature of genes?	7
1.6 What is the role of chance in evolution?	7
1.7 At what level does natural selection act?	7
1.8 What in general does evolution produce?	8
<b>2 The pattern of evolution: molecular evidence</b>	<b>12</b>
2.1 How should we classify animals?	12
2.2 How can we use morphology to trace phylogeny?	13
2.3 How can we use molecules to trace phylogeny?	16
2.4 Which molecules are used?	16
2.5 How is molecular information obtained?	17
2.6 How is molecular information processed?	18
2.7 How reliable is molecular taxonomy?	19
2.8 What is the present state of phylogenetic enquiry?	20
<b>3 Porifera</b>	<b>21</b>
3.1 What are the distinguishing characters of sponges?	21
3.2 What different kinds of sponge are known?	22
3.3 How do sponges make a living?	24
3.4 How are sponges related to other phyla?	27

3.5	What changes have evolved during sponge history?	28
3.6	How have sponges become so successful?	29
<b>4</b>	<b>Cnidaria</b>	<b>30</b>
4.1	Why do we regard Cnidaria as simple?	30
4.2	How do Cnidaria make a living?	33
4.3	What kinds of Cnidaria are known?	41
4.4	How has so much diversity been possible?	41
4.5	What is the ecological importance of coral reefs?	45
4.6	How are Cnidaria related to each other and to other animals?	46
<b>5</b>	<b>On being a worm</b>	<b>47</b>
5.1	Why are there so many different kinds of worm?	47
5.2	How can muscles move a worm?	48
5.3	What worm phyla are known?	54
5.4	Do Ctenophora belong among the worms?	65
<b>6</b>	<b>Platyhelminthes</b>	<b>68</b>
6.1	What is the body plan of the phylum?	68
6.2	What groups of worms constitute the Platyhelminthes?	70
6.3	Is simplicity a reliable guide to phylogeny?	70
6.4	Should the Acoela be placed in a separate phylum?	71
6.5	What is specialised about modern platyhelminths?	72
6.6	How are platyhelminths related to each other?	79
6.7	Can platyhelminths represent our ancestors?	80
<b>7</b>	<b>Nemertea</b>	<b>81</b>
7.1	What are the principal groups of nemertines?	81
7.2	How do nemertines resemble platyhelminths?	83
7.3	How do nemertines differ from platyhelminths?	83
7.4	What diversity exists among nemertines?	92
7.5	How are nemertines related to other phyla?	94
<b>8</b>	<b>Nematoda</b>	<b>99</b>
8.1	What are the distinctive characters of nematodes?	100
8.2	How are these characters related to the cuticle and fluid pressure?	100
8.3	How is the phylum subdivided?	104
8.4	How are nematodes related to other animals?	105
8.5	Why are nematodes useful for developmental studies?	105
8.6	Conclusion	108
<b>9</b>	<b>Annelida</b>	<b>109</b>
9.1	What is an annelid?	110
9.2	What annelids are there and how are they related?	110
9.3	What are the advantages of the coelom and of metamerism?	113
9.4	How does a coelom introduce complexity?	119
9.5	How do annelids reproduce and feed?	123
9.6	How are annelids related to other phyla?	124

<b>10 Mollusca: general and Gastropoda</b>	<b>131</b>
10.1 What is the basic molluscan body plan?	131
10.2 How can such an animal function?	134
10.3 What is the shell and how may it be used?	135
10.4 What are the main groups of molluscs?	136
10.5 What are the evolutionary relationships of molluscs?	137
<b>Gastropoda</b>	<b>141</b>
10.6 How is the molluscan body plan modified in gastropods?	141
10.7 How may gastropods feed?	146
10.8 Why are many gastropods hermaphrodites?	147
10.9 Conclusion	151
<b>11 Mollusca: Bivalvia and Cephalopoda</b>	<b>152</b>
11.1 How is the molluscan body plan modified in bivalves?	152
11.2 What is the range of bivalves?	152
11.3 How do bivalves feed?	154
11.4 What kinds of muscle are there in bivalves?	155
<b>Scaphopoda</b>	<b>158</b>
<b>Cephalopoda</b>	<b>158</b>
11.5 How is the molluscan body plan modified in cephalopods?	158
11.6 What cephalopods are known?	159
11.7 How is <i>Nautilus</i> able to survive?	161
11.8 How have some cephalopods become so active?	164
11.9 What has limited the evolution of cephalopods?	173
<b>12 Arthropoda: general</b>	<b>174</b>
12.1 What defines an arthropod?	175
12.2 What are the key features of arthropod cuticle?	175
12.3 How are arthropod internal cavities organised?	180
12.4 What makes possible the great activity of arthropods?	181
12.5 What arthropod relations are known?	190
<b>13 Crustacea</b>	<b>193</b>
13.1 What is distinctive about crustaceans?	193
13.2 What are the main kinds of crustacean?	194
13.3 How have crustaceans colonised fresh water and land?	202
13.4 What are the special features of parasitic crustaceans?	204
13.5 What is the role of crustacean larvae?	205
<b>14 Chelicerata and Myriapoda</b>	<b>207</b>
14.1 What are chelicerates?	207
14.2 Why is <i>Limulus</i> of special interest?	208
14.3 What are pycnogonids?	209
14.4 What are arachnids?	211
14.5 How did arachnids colonise the land?	212

<b>Myriapoda</b>	217
14.6 What are myriapods and how do they move?	217
14.7 How well are myriapods adapted to life on land?	221
<b>15 Insecta</b>	222
15.1 What is an insect?	222
15.2 Why are insects such successful land animals?	223
15.3 How are insects able to fly?	227
15.4 What is distinctive about insect life cycles?	233
15.5 What are the main Orders of insects?	235
15.6 How could social behaviour have evolved?	244
15.7 Why has study of the fruitfly <i>Drosophila</i> been so important?	245
<b>16 Animals with lophophores</b>	248
16.1 What is a lophophore?	248
16.2 Which animals have lophophores?	248
16.3 Are animals with lophophores protostomes or deuterostomes?	253
16.4 What are the relationships of Entoprocta?	254
16.5 Should there be a group called 'Lophophorata'?	256
<b>17 Echinodermata</b>	259
17.1 What is unique about echinoderms?	259
17.2 What is unusual, but not unique, about echinoderms?	261
17.3 How do different echinoderms feed and move?	264
17.4 Do the larvae illuminate echinoderm evolution?	269
<b>18 Invertebrate Chordata</b>	277
18.1 What are the chordate characters?	277
18.2 Which are the invertebrate chordates?	279
18.3 What are the relationships of invertebrate chordates?	286
<b>19 Development</b>	289
19.1 How do animals develop?	289
19.2 What makes different animals develop differently?	290
19.3 What is the pattern of cleavage in invertebrates?	290
19.4 How do invertebrates gastrulate?	297
19.5 How is polarity established and maintained?	297
19.6 What happens in later development?	300
19.7 What can studies of regeneration tell us about development?	300
19.8 How do genes control development?	303
19.9 What are <i>Hox</i> genes?	303
19.10 How do <i>Hox</i> genes act in different animals?	304
19.11 Conclusion	306
<b>20 Invertebrate evolutionary history</b>	307
20.1 How can we trace the course of evolution?	307
20.2 What are fossils?	308

20.3 What can fossils tell us about evolution?	308
20.4 Can we date the earliest appearance of animals?	310
20.5 What do molecules tell us about relationships between phyla?	312
20.6 What do molecules tell us about relationships within phyla?	317
20.7 Can we now define homology?	322
20.8 Conclusion.	323
