CRC Series in CONTEMPORARY FOOD SCIENCE

Series Editor Fergus M. Clydesdale

Advanced Quantitative Microbiology for Foods and Biosystems

Models for Predicting Growth and Inactivation

Micha Peleg

CRC Taylor & Francis
Taylor & Francis Group

Contents

1 Isothermal Microbial Heat Inactivation 1

Primary Models — the Traditional Approach 1

The First-Order Kinetics and the *D* Value 1

The "Thermal Death Time" 4

Biphasic and Multiexponential Decay Models and Their Limitations 5

The Logistic Models 9

Concluding Remarks to This Section 10

The Survival Curve as a Cumulative Form of the Heat Distribution Resistances 11

The Weibull Distribution 17

Interpretation of the Concavity Direction 22

The Fermi (Logistic) Distribution Function 23

The Activation Shoulder 27

Estimation of the Number of Recoverable Spores 30

Sigmoid and Other Kinds of Semilogarithmic Survival Curves 33

Sigmoid Curves 33

Residual Survival (Strong "Tailing") 37

Can an Absolute Thermal Death Time Exist? 38

Secondary Models 40

The "z" Value and the Arrhenius Equation 41

The Log Logistic Model 44

A Discrete $b(T)$ vs. T 46

Other Empirical Models 47

2 Nonisothermal Heat Inactivation 49

The Traditional Approach 49

The F_0 Value and Its Limitations 50

The Proposed Alternative 53

Nonisothermal Weibuillian Survival 57

The Rate Model 57

Heating and Cooling 59

Simulation of Heating Curves by Empirical Models 59

Simulated Survival Curves for Processes with Different Target Temperature and Holding Durations 62

Temperate Oscillations 64
Discontinuous Temperature Profiles 65
The Special Case of Log Linear Isothermal Survival 66
Non-Weibullian Survival Models 68
Logistic (Fermian) Survival 69
Extreme Tailing 70
Sigmoid Survival Curves 73
Isothermal Survival Model's Equation with No Analytic Inverse 75
Independence of the Calculated Nonisothermal Survival Curve of the Chosen Survival Model 77
Experimental Verification of the Model 78
The Isothermal and Nonisothermal Inactivation Patterns of *L. monocytogenes* 80
The Isothermal and Nonisothermal Inactivation of *Salmonella* 81
Isothermal and Nonisothermal Survival Curves of *B. sporothermodurans* Spores in Soups 84
The Isothermal and Nonisothermal Inactivation of *E. coli* 84
Heat-Induced Chemical and Physical Changes 90

3 Generating Nonisothermal Heat Inactivation Curves with Difference Equations in Real Time (Incremental Method) 95
The Difference Equation of the Weibullian–Log Logistic Nonisothermal Survival Model 96
Non-Weibullian Survival Curves 102
Comparison between the Continuous and Incremental Models 106

4 Estimation of Microbial Survival Parameters from Nonisothermal Inactivation Data 111
The Linear Case 113
Linear Survival at Constant Rate Heating 113
Linear Survival at Varying Heating Rate 116
The Nonlinear Case 120
Weibullian–Power Law Inactivation at Arbitrary Heating Rate History 120
Testing the Concept with Simulated Data 120
Testing the Method with *Salmonella* Survival Data 124
Salmonella in a Growth Medium 124
Salmonella in Minced Chicken Meat 129
Concluding Remarks 130

5 Isothermal Inactivation with Stable and Dissipating Chemical Agents 135
Chemical Inactivation under "Constant" Agent Concentration 137
Microbial Inactivation with a Dissipating Chemical Agent 139
Traditional Models 140
Alternative General Model 142
Dissipation and Inactivation 145
Monotonic Agent Dissipation 145
Agent Dissipation with Regular and Random Oscillations 148
Agent Replenishment 154
Estimation of Survival Parameters from Data Obtained during Treatments with a Dissipating Agent 157
Demonstrations of the Procedure with Published Data 161
Discrete Version of Survival Model 163

6 High CO_2 and Ultrahigh Hydrostatic Pressure Preservation 165
Microbial Inactivation under High CO_2 Pressure 167
Effect of Pressure Level and Treatment Duration 170
Is the Pressurization Rate a Factor? 174
Ultrahigh Pressure 177
Ultrahigh-Pressure Treatment in a Perfectly Insulated Vessel 182
Treatment in an Uninsulated Vessel 185
How to Use the Model 186

7 Dose–Response Curves 189
The Fermi (Logistic) Distribution 190
The Weibull Distribution 196
Mixed Populations 200

8 Isothermal and Nonisothermal Bacterial Growth in a Closed Habitat 205
The Traditional Models 205
The Logistic Equation and the Logistic Function 206
The Gompertz, Baranyi and Roberts, and Other Growth Models 211
The Lag Time 213
The Logistic–Fermi Combination Model 214
Simulation of Nonisothermal Growth Pattern Using the Logistic–Fermi Model 220

Monotonic Temperature Histories 226
Regular and Random Temperature Oscillations 226
Prediction of Nonisothermal Growth Patterns from Isothermal Growth Data 231
The Growth of *Pseudomonas* in Refrigerated Fish 235
The Growth of *E. coli* 241

9 Interpretation of Fluctuating Microbial Count Records in Foods and Water 247
Microbial Quality Control in a Food Plant 249
The Origins and Nature of Microbial Count Fluctuations 250
Asymmetry between Life and Death 251
Estimating the Frequency of Future Outbursts — the Principle 252
Testing the Counts' Independence 254
Uneven Rounding and Record Derounding 258
Choosing a Distribution Function 261
Nonparametric Distributions 261
Parametric Distributions 262
Calculation of a Distribution's Parameters 262
The Q–Q Plot 265
Truncated Distributions 267
Exinction and Absence 269
Special Patterns 270
Populations with a Detection Threshold Level 270
Records of Positive/Negative Entries 273
Records with a True or Suspected Trend or Periodicity 274

10 Estimating Frequencies of Future Microbial High Counts or Outbursts in Foods and Water — Case Studies 277
Microbial Counts in a Cheese-Based Snack 278
Analysis of Raw Records 278
Analysis of Normalized Data 285
Rating Raw Milk Sources 289
Frozen Foods 293
E. coli in Wash Water of a Poultry Plant 298
Fecal Bacteria in Lake Kinneret 307
Characterization of Count Distributions 311
Nonlogarithmic Transformations of the Counts 311
Finding a Truncated Distribution 312
Distribution of Fecal Bacteria in the Lake's Water 312
Estimating the Frequency of Future Outbursts 315
Issues of Concern 317

11 A Probabilistic Model of Historic Epidemics 321
The Model 322
Mortality from Smallpox and Measles in 18th Century England 324
Smallpox 324
Measles 328
Potential Uses of the Model 331

12 Aperiodic Microbial Outbursts with Variable Duration 333
Microbial Fluctuations in a Water Reservoir 334
Determination of Model Parameters 338
Fluctuation Parameters of the Massachusetts Water Reservoir 340
Validation of the Threshold Estimation Method 342
A Model of Pathogen Outbursts in Foods 348
Other Potential Applications of the Model 355

13 Outstanding Issues and Concluding Remarks 359
Inactivation Models 359
Determination of Survival Parameters from Inactivation Curves Determined under Nonisothermal Conditions 359
Modeling and Predicting Survival Patterns when Several Influential Factors Vary Simultaneously 362
Non-Weibullian Inactivation Patterns 365
Systems in which the Inoculum Size May Affect Inactivation 366
Robustness and Sensitivity 367
Relationship between Survival Parameters and Inactivation Mechanism 368
Alternative Inactivation Technologies 368
Growth Models 369
Terminology 369
Growth under Changing Conditions 369
Growth under Arbitrary Conditions 370
Simultaneous Growth and Inactivation or Inactivation and Growth 371
Fluctuating Records in Water and Foods 372
Censored Data 372
Sampling at Different Locations 373
Risk Assessment 373
A Few Last Remarks 374
