ROCK QUALITY, SEISMIC VELOCITY, ATTENUATION AND ANISOTROPY

NICK BARTON

Table of contents

Preface **XIII**

Introduction **XIX**
The multi-disciplinary scope of seismic and rock quality XIX
Revealing hidden rock conditions XX
Some basic principles of P, S and Q XX
Q and Q XXI
Limitations of refraction seismic bring tomographic solutions XXII

Nomenclature **XXIII**

PART I

1 Shallow seismic refraction, some basic theory, and the importance of rock type **3**
1.1 The challenge of the near-surface in civil engineering 3
1.2 Some basic aspects concerning elastic body waves 4
1.2.1 Some sources of reduced elastic moduli 5
1.3 Relationships between V_p and V_s and their meaning in field work 6
1.4 Some advantages of shear waves 7
1.5 Basic estimation of rock-type and rock mass condition, from shallow seismic P-wave velocity 9
1.6 Some preliminary conversions from velocity to rock quality 12
1.7 Some limitations of the refraction seismic velocity interpretations 13
1.8 Assumed limitations may hide the strengths of the method 16
1.9 Seismic quality Q and apparent similarities to Q-rock 17

2 Environmental effects on velocity **19**
2.1 Density and V_p 19
2.2 Porosity and V_p 24
2.3 Uniaxial compressive strength and V_p 25
2.4 Weathering and moisture content 27
2.5 Combined effects of moisture and pressure 30
2.6 Combined effects of moisture and low temperature 32

3 Effects of anisotropy on V_p **35**
3.1 An introduction to velocity anisotropy caused by micro-cracks and jointing 35
3.2 Velocity anisotropy caused by fabric 38
3.3 Velocity anisotropy caused by rock joints 40
3.4 Velocity anisotropy caused by interbedding 45
3.5 Velocity anisotropy caused by faults 47

4 Cross-hole velocity and cross-hole velocity tomography **49**
4.1 Cross-hole seismic for extrapolation of properties 49
4.2 Cross-hole seismic tomography in tunnelling 52
4.3 Cross-hole tomography in mining 58
4.4 Using tomography to monitor blasting effects 61
4.5 Alternative tomograms 64
4.6 Cross-hole or cross-well reflection measurement and time-lapse tomography 66

5 Relationships between rock quality, depth and seismic velocity **69**
5.1 Some preliminary relationships between RQD, F, and V_p 69
5.2 Relationship between rock quality Q and V_p for hard jointed, near-surface rock masses 74
5.3 Effects of depth or stress on acoustic joint closure, velocities and amplitudes 77
5.3.1 Compression wave amplitude sensitivities to jointing 83
5.3.2 Stress and velocity coupling at the Gjøvik cavern site 88
5.4 Observations of effective stress effects on velocities 88
5.5 Integration of velocity, rock mass quality, porosity, stress, strength, deformability 92

6 Deformation moduli and seismic velocities **97**
6.1 Correlating V_p with the 'static' moduli from deformation tests 97
6.2 Dynamic moduli and their relationship to static moduli 104
6.3 Some examples of the three dynamic moduli 109
6.4 Use of shear wave amplitude, frequency and petite-sismique 110
6.5 Correlation of deformation moduli with RMR and Q 111

7 Excavation disturbed zones and their seismic properties **117**
7.1 Some effects of the free-surface on velocities and attenuation 117
7.2 EDZ phenomena around tunnels based on seismic monitoring 119
7.3 EDZ investigations in selected nuclear waste isolation studies 124
7.3.1 BWIP – EDZ studies 124
7.3.2 URL – EDZ studies 127
7.3.3 Äspö – EDZ studies 131
7.3.4 Stripa – effects of heating in the EDZ of a rock mass 133
7.4 Acoustic detection of stress effects around boreholes 136

8 Seismic measurements for tunnelling **139**
8.1 Examples of seismic applications in tunnels 139
8.2 Examples of the use of seismic data in TBM excavations 148
8.3 Implications of inverse correlation between TBM advance rate and V_p 149
8.4 Use of probe drilling and seismic or sonic logging ahead of TBM tunnels 151
8.5 In-tunnel seismic measurements for looking ahead of the face 152
8.6 The possible consequences of insufficient seismic investigation due to depth limitations 154

9 Relationships between V_p, Lugeon value, permeability and grouting in jointed rock **159**
9.1 Correlation between V_p and Lugeon value 159
9.2 Rock mass deformability and the V_p-L-Q correlation 162
9.3 Velocity and permeability measurements at in situ block tests 165
9.4 Detection of permeable zones using other geophysical methods 169
9.5 Monitoring the effects of grouting with seismic velocity 170
9.6 Interpreting grouting effects in relation to improved rock mass Q-parameters 172

PART II

10 Seismic quality Q and attenuation at many scales **181**
10.1 Some basic aspects concerning attenuation and $Q_{seismic}$ 181
10.1.1 A preliminary discussion of the importance of strain levels 183
10.1.2 A preliminary look at the attenuating effect of cracks of larger scale 184
10.2 Attenuation and seismic Q from laboratory measurement 186
10.2.1 A more detailed discussion of friction as an attenuation mechanism 187

10.2.2 Effects of partial saturation on seismic Q 189
10.3 Effect of confining pressure on seismic Q 190
10.3.1 The four components of elastic attenuation 193
10.3.2 Effect on Q_p and Q_s of loading rock samples towards failure 195
10.4 The effects of single rock joints on seismic Q 197
10.5 Attenuation and seismic Q from near-surface measurements 202
10.5.1 Potential links to rock mass quality parameters in jointed rock 202
10.5.2 Effects of unconsolidated sediments on seismic Q 205
10.5.3 Influence of frequency variations on attenuation in jointed and bedded rock 207
10.6 Attenuation in the crust as interpreted from earthquake coda 209
10.6.1 Coda Q_c from earthquake sources and its relation to rock quality Q_c 209
10.6.2 Frequency dependence of coda Q_c due to depth effects 210
10.6.3 Temporal changes of coda Q_c prior to earthquakes 212
10.6.4 Possible separation of attenuation into scattering and intrinsic mechanisms 213
10.6.5 Changed coda Q during seismic events 214
10.6.6 Attenuation of damage due to acceleration 218
10.6.7 Do microcracks or tectonic structure cause attenuation 219
10.6.8 Down-the-well seismometers to minimise site effects 221
10.6.9 Rock mass quality parallels 224
10.7 Attenuation across continents 226
10.7.1 Plate tectonics, sub-duction zones and seismic Q 226
10.7.2 Young and old oceanic lithosphere 228
10.7.3 Lateral and depth variation of seismic Q and seismic velocity 228
10.7.4 Cross-continent Lg coda Q variations and their explanation 230
10.7.5 Effect of thick sediments on continental Lg coda 231
10.8 Some recent attenuation measurements in petroleum reservoir environments 232
10.8.1 Anomalous values of seismic Q in reservoirs due to major structures 235
10.8.2 Evidence for fracturing effects in reservoirs on seismic Q 236
10.8.3 Different methods of analysis give different seismic Q 238

11 Velocity structure of the earth's crust 241
11.1 An introduction to crustal velocity structures 241
11.2 The continental velocity structures 244
11.3 The continental margin velocity structures 254
11.3.1 Explaining a velocity anomaly 256
11.4 The mid-Atlantic ridge velocity structures 261
11.4.1 A possible effective stress discrepancy in early testing 263
11.4.2 Smoother depth velocity models 265
11.4.3 Recognition of lower effective stress levels beneath the oceans 266
11.4.4 Direct observation of sub-ocean floor velocities 267
11.4.5 Sub-ocean floor attenuation measurements 268
11.4.6 A question of porosities, aspect ratios and sealing 270
11.4.7 A velocity-depth discussion 271
11.4.8 Fracture zones 272
11.5 The East Pacific Rise velocity structures 273
11.5.1 More porosity and fracture aspect ratio theories 276
11.5.2 First sub-Pacific ocean core with sonic logs and permeability tests 277
11.5.3 Attenuation and seismic Q due to fracturing and alteration 279
11.5.4 Seismic attenuation tomography across the East Pacific Rise 281
11.5.5 Continuous sub-ocean floor seismic profiles 283

11.6 Age effects summary for Atlantic Ridge and Pacific Rise 287
11.6.1 Decline of hydrothermal circulation with age and sediment cover 289
11.6.2 The analogy of pre-grouting as a form of mineralization 291

12 Rock stress, pore pressure, borehole stability and sonic logging 295
12.1 Pore pressure, over-pressure, and minimum stress 295
12.1.1 Pore pressure and over-pressure and cross-discipline terms 295
12.1.2 Minimum stress and mud-weight 296
12.2 Stress anisotropy and its intolerance by weak rock 297
12.2.1 Reversal of K_0 trends nearer the surface 299
12.3 Relevance to logging of borehole disturbed zone 301
12.4 Borehole in continuum becomes borehole in local *discontinuum* 302
12.5 The EDZ caused by joints, fractures and bedding-planes 306
12.6 Loss of porosity due to extreme depth 311
12.7 Dipole shear-wave logging of boreholes 312
12.7.1 Some further development of logging tools 315
12.8 Mud filtrate invasion 316
12.9 Challenges from ultra HPHT 320

13 Rock physics at laboratory scale 323
13.1 Compressional velocity and porosity 323
13.2 Density, V_s and V_p 324
13.3 Velocity, aspect ratio, pressure, brine and gas 326
13.4 Velocity, temperature and influence of fluid 328
13.5 Velocity, clay content and permeability 331
13.6 Stratigraphy based velocity to permeability estimation 332
13.6.1 Correlation to field processes 334
13.7 Velocity with patchy saturation effects in mixed units 335
13.8 Dynamic Poisson's ratio, effective stress and pore fluid 337
13.9 Dynamic moduli for estimating static deformation moduli 339
13.10 Attenuation due to fluid type, frequency, clay, over-pressure, compliant minerals, dual porosity 341
13.10.1 Comparison of velocity and attenuation in the presence of gas or brine 341
13.10.2 Attenuation when dry or gas or brine saturated 341
13.10.3 Effect of frequency on velocity and attenuation, dry or with brine 342
13.10.4 Attenuation for distinguishing gas condensate from oil and water 343
13.10.5 Attenuation in the presence of clay content 345
13.10.6 Attenuation due to compliant minerals and microcracks 346
13.10.7 Attenuation with dual porosity samples of limestones 348
13.10.8 Attenuation in the presence of over-pressure 350
13.11 Attenuation in the presence of anisotropy 351
13.11.1 Attenuation for fluid front monitoring 352
13.12 Anisotropic velocity and attenuation in shales 354
13.12.1 Attenuation anisotropy expressions ε, γ and δ 356
13.13 Permeability and velocity anisotropy due to fabric, joints and fractures 357
13.13.1 Seismic monitoring of fracture development and permeability 359
13.14 Rock mass quality, attenuation and modulus 365

14 P-waves for characterising fractured reservoirs 369
14.1 Some classic relationships between age, depth and velocity 369

14.2 Anisotropy and heterogeneity caused by inter-bedded strata and jointing 372
14.2.1 Some basic anisotropy theory 373
14.3 Shallow cross-well seismic tomography 374
14.3.1 Shallow cross-well seismic in fractured rock 377
14.3.2 Cross-well seismic tomography with permeability measurement 377
14.3.3 Cross-well seismic in deeper reservoir characterization 378
14.4 Detecting finely inter-layered sequences 379
14.4.1 Larger scale differentiation of facies 380
14.5 Detecting anisotropy caused by fractures with multi-azimuth VSP 382
14.5.1 Fracture azimuth and stress azimuth from P-wave surveys 382
14.5.2 Sonic log and VSP dispersion effects and erratic seismic Q 386
14.6 Dispersion as an alternative method of characterization 386
14.7 AVO and AVOA using P-waves for fracture detection 388
14.7.1 Model dependence of AVOA fracture orientation 391
14.7.2 Conjugate joint or fracture sets also cause anisotropy 392
14.7.3 V_p anisotropy caused by faulting 394
14.7.4 Poisson's ratio anisotropy caused by fracturing 394
14.8 4C four-component acquisition of seismic including C-waves 394
14.9 4D seismic monitoring of reservoirs 397
14.9.1 Possible limitations of some rock physics data 397
14.9.2 Oil saturation mapping with 4D seismic 397
14.10 4D monitoring of compaction and porosity at Ekofisk 398
14.10.1 Seismic detection of subsidence in the overburden 400
14.10.2 The periodically neglected joint behaviour at Ekofisk 401
14.11 Water flood causes joint opening and potential shearing 402
14.12 Low frequencies for sub-basalt imaging 403
14.13 Recent reservoir anisotropy investigations involving P-waves and attenuation 404

15 Shear wave splitting in fractured reservoirs and resulting from earthquakes 407
15.1 Introduction 407
15.2 Shear wave splitting and its many implications 408
15.2.1 Some sources of shear-wave splitting 410
15.3 Crack density and EDA 411
15.3.1 A discussion of 'criticality' due to microcracks 412
15.3.2 Temporal changes in polarization in Cornwall HDR 413
15.3.3 A critique of Crampin's microcrack model 415
15.3.4 90°-flips in polarization 415
15.4 Theory relating joint compliances with shear wave splitting 416
15.4.1 An unrealistic rock simulant suggests equality between Z_N and Z_T 417
15.4.2 Subsequent inequality of Z_N and Z_T 419
15.4.3 Off-vertical fracture dip or incidence angle, and normal compliance 419
15.4.4 Discussion of scale effects and stiffness 421
15.5 Dynamic and static stiffness tests on joints by Pyrak-Nolte 422
15.5.1 Discussion of stiffness data gaps and discipline bridging needs 424
15.5.2 Fracture stiffness and permeability 425
15.6 Normal and shear compliance theories for resolving fluid type 425
15.6.1 In situ compliances in a fault zone inferred from seismic Q 427
15.7 Shear wave splitting from earthquakes 428
15.7.1 Shear-wave splitting in the New Madrid seismic zone 428
15.7.2 Shear-wave splitting at Parkfield seismic monitoring array 429

15.7.3 Shear-wave splitting recorded at depth in Cajon Pass borehole 432
15.7.4 Stress-monitoring site (SMS) anomalies from Iceland 432
15.7.5 SW-Iceland, Station BJA shear wave anomalies 433
15.7.6 Effects of shearing on stiffness and shear wave amplitude 435
15.7.7 Shear-wave splitting at a geothermal field 435
15.7.8 Shear wave splitting during after-shocks of the Chi-Chi earthquake in Taiwan 436
15.7.9 Shear-wave splitting under the Mid-Atlantic Ridge 436
15.8 Recent cases of shear wave splitting in petroleum reservoirs 438
15.8.1 Some examples of S-wave and PS-wave acquisition methods 438
15.8.2 Classification of fractured reservoirs 440
15.8.3 Crack density and shearing of conjugate sets at Ekofisk might enhance splitting 442
15.8.4 Links between shear wave anisotropy and permeability 445
15.8.5 Polarization-stress alignment from shallow shear-wave splitting 447
15.8.6 Shear-wave splitting in argillaceous rocks 450
15.8.7 Time-lapse application of shear-wave splitting over reservoirs 451
15.8.8 Temporal shear-wave splitting using AE from the Valhall cap-rock 454
15.8.9 Shear-wave splitting and fluid identification at the Natih field 455
15.9 Dual-porosity poro-elastic modelling of dispersion and fracture size effects 459
15.9.1 A brief survey of rock mechanics pseudo-static models of jointed rock 460
15.9.2 A very brief review of slip-interface, fracture network and poro-elastic crack models 461
15.9.3 Applications of Chapman model to Bluebell Altamont fractured gas reservoir 471
15.9.4 The SeisRox model 475
15.9.5 Numerical modelling of dynamic joint stiffness effects 476
15.9.6 A 'sugar cube' model representation 479
15.10 A porous and fractured physical model as a numerical model validation 480

16 Joint stiffness and compliance and the joint shearing mechanism 483
16.1 Some important non-linear joint and fracture behaviour modes 483
16.2 Aspects of fluid flow in deforming rock joints 486
16.2.1 Coupled stress-flow behaviour under normal closure 487
16.2.2 Coupled stress-flow behaviour under shear deformation 488
16.3 Some important details concerning rock joint stiffnesses K_n and K_s 492
16.3.1 Initial normal stiffness measured at low stress 494
16.3.2 Normal stiffness at elevated normal stress levels 495
16.4 Ratios of K_n over K_s under static and dynamic conditions 497
16.4.1 Frequency dependence of fracture normal stiffness 497
16.4.2 Ratios of static K_n to static K_s for different block sizes 498
16.4.3 Field measurements of compliance Z_N 499
16.4.4 Investigation of normal and shear compliances on artificial surfaces in limestones 501
16.4.5 The Worthington-Lubbe-Hudson range of compliances 503
16.4.6 Pseudo-static stiffness data for clay filled discontinuities and major shear zones 505
16.4.7 Shear stress application may apparently affect compliance 506
16.5 Effect of dry or saturated conditions on shear and normal stiffnesses 507
16.5.1 Joint roughness coefficient (JRC) 508
16.5.2 Joint wall compression strength (JCS) 509
16.5.3 Basic friction angle ϕ_b and residual friction angle ϕ_r 509
16.5.4 Empirical equations for the shear behaviour of rock joints 511
16.6 Mechanical over-closure, thermal-closure, and joint stiffness modification 513
16.6.1 Normal stiffness estimation 515

16.6.2 Thermal over-closure of joints and some implications 515
16.6.3 Mechanical over-closure 517
16.7 Consequences of shear stress on polarization and permeability 517
16.7.1 Stress distribution caused by shearing joints, and possible consequences for shear wave splitting 518
16.7.2 The strength-deformation components of jointed rock masses 520
16.7.3 Permeability linked to joint shearing 523
16.7.4 Reservoir seismic case records with possible shearing 525
16.7.5 The apertures expected of highly stressed 'open' joints 526
16.7.6 Modelling apertures with the BB model 531
16.7.7 Open joints caused by anisotropic stress, low shear strength, dilation 534
16.8 Non-linear shear strength and the critical shearing crust 536
16.8.1 Non-linear strength envelopes and scale effects 536
16.9 Critically stressed open fractures that indicate conductivity 541
16.9.1 The JRC contribution at different scales and deformations 544
16.9.2 Does pre-peak or post-peak strength resist the assumed crustal shear stress? 545
16.10 Rotation of joint attributes and unequal conjugate jointing may explain azimuthal deviation of S-wave polarization 548
16.11 Classic stress transformation equations ignore the non-coaxiality of stress and displacement 552
16.12 Estimating shallow crustal permeability from a modified rock quality Q-water 554
16.12.1 The problem of clay-sealed discontinuities 555

17 Conclusions **559**

Appendix A – The Q_{rock} parameter ratings **615**
The six parameters defined 615
Combination in pairs 615
Definitions of characterization and classification as used in rock engineering 615
Notes on Q-method of rock mass classification 615

Appendix B – A worked example **625**
