 WILEY-VCH

High-frequency Electrodynamics

Contents

Preface *XI*

1	The Maxwell Equations	1
1.1	Complex amplitudes	1
1.1.1	Harmonic (monochromatic) oscillations	1
1.1.2	Complex amplitudes	2
1.1.3	The period-average product of two harmonic functions	3
1.2	The Maxwell equations	4
1.2.1	The conduction current and the extrinsic current	4
1.2.2	The Maxwell equations	5
1.2.3	Dielectric permittivity and magnetic permeability of a medium	6
1.2.4	The polarization current	7
1.2.5	The frequency dispersion and the spatial dispersion (chirality)	10
1.2.6	Complex permittivity	11
1.2.7	The radiation condition	12
1.2.8	The wave equations	14
1.2.9	The reciprocity conditions	16
1.2.10	Average energy losses	18
1.2.11	The dispersion relations	19
1.3	Idealized objects	22
1.3.1	Interface of two media	22
1.3.2	The impedance (one-side) boundary conditions	24
1.3.3	Skin layer	24
1.3.4	Ideal conductor	27
1.3.5	Singularities of fields near the edge or vertex	28
1.3.6	The line current and the point current	32
1.4	Uniqueness and existence of solution	35
1.4.1	Uniqueness of solution	35
1.4.2	Violation of the uniqueness theorem: eigenoscillations	38

2	Plane Waves	41
2.1	Plane waves in an infinite homogeneous medium	41
2.1.1	The phase velocity	41
2.1.2	The elliptic polarization	43
2.1.3	Eigenwaves in chiral media	45
2.1.4	Turning of the polarization plane in the chiral media	47
2.1.5	The group velocity	48
2.1.6	The relativity restrictions on the propagation factor	50
2.2	Plane waves in a plano-layered medium	52
2.2.1	Medium with constant wave resistance	52
2.2.2	The slowly varying wave resistance	55
2.2.3	The periodical layer	57
2.2.4	Nonreflecting coating	59
2.2.5	The oblique incidence	61
2.2.6	Plano-parallel chiral medium	64
2.2.7	Media with $\varepsilon < 0, \mu < 0$	66
3	Closed Waveguides	71
3.1	Eigenmodes in nonfilled waveguides	71
3.1.1	Eigenmodes	71
3.1.2	The TM-, TE-, and TEM-modes	74
3.1.3	The functional orthogonality of the fields of eigenmodes	75
3.1.4	The electric and magnetic Hertz vectors	77
3.1.5	Rectangular waveguides	78
3.1.6	Circular waveguides	81
3.1.7	Multiple-connected cross-sections	83
3.2	Waves in waveguides with nonhomogeneous cross-section filling	86
3.2.1	Nonhomogeneous filling and impedance walls	86
3.2.2	Wave number in impedance waveguide	87
3.2.3	Losses in impedance waveguide	91
3.2.4	Orthogonality condition	93
3.2.5	Complex and associated modes	95
3.3	Excitation of closed waveguides	97
3.3.1	Excitation by extrinsic current	97
3.3.2	The slot excitation and end-plane excitation	100
3.3.3	Integration in the plane of a complex variable	102
3.4	Nonregular closed waveguides	108
3.4.1	The cross-section method	108
3.4.2	Slowly varying parameters	113
3.4.3	The diaphragm: equation for field in the slot	116
3.4.4	The diaphragm: equation for current on strips	119

- 3.4.5 Diffraction on the screen with a hole 120
- 3.4.6 Open end of waveguide 125

- 4 Closed Resonators 129**
 - 4.1 Resonators with ideal-conducting walls 129
 - 4.1.1 Waveguide resonators without filling 129
 - 4.1.2 Resonators of arbitrary shape 132
 - 4.1.3 Calculation of eigenfrequencies 134
 - 4.1.4 Variational technique 136
 - 4.1.5 Excitation of resonators 139
 - 4.2 Resonators with impedance walls 143
 - 4.2.1 Complex eigenfrequencies 143
 - 4.2.2 Displacement of eigenfrequencies 146
 - 4.2.3 Impedance as a spectral parameter 147

- 5 Open Lines 151**
 - 5.1 Dielectric waveguides 151
 - 5.1.1 Circular dielectric waveguides 151
 - 5.1.2 Eigenmodes of dielectric waveguides with arbitrary cross-section 154
 - 5.1.3 Excitation of dielectric waveguides 157
 - 5.1.4 Nonregular dielectric waveguides 163
 - 5.1.5 The optical fiber 166
 - 5.2 The lines with surface wave 170
 - 5.2.1 Nonideal metallic cylinder 170
 - 5.2.2 The ideal metallic cylinder covered by a thin dielectric layer 173
 - 5.2.3 The short-periodical surface 175
 - 5.2.4 The corrugated surface 178
 - 5.2.5 Slow waves in closed waveguides 181
 - 5.2.6 The helix line; the array 184
 - 5.2.7 The microstrip line 187
 - 5.3 The wave beam 189
 - 5.3.1 The wave beam 189
 - 5.3.2 Parabolic equation 193
 - 5.3.3 The energy transmission coefficient 195
 - 5.3.4 Optimal antenna and rectenna shapes 198
 - 5.3.5 Fields in the rectenna plane 201
 - 5.3.6 Free phase of desired field on rectenna 203
 - 5.3.7 The lens line 206

- 6 Backgrounds of Antenna Theory 211**
 - 6.1 Radiation of current set 211

- 6.1.1 The elementary electric dipole and multipole 211
- 6.1.2 Field of arbitrary currents 215
- 6.1.3 The elementary magnetic dipole and multipole 218
- 6.1.4 The half-wave vibrator 219
- 6.1.5 The multivibrator antenna 224
- 6.2 Aperture antennas 225
 - 6.2.1 Radiation from aperture 225
 - 6.2.2 The Green function method 228
 - 6.2.3 The radiation pattern 230
 - 6.2.4 Inverse problem 232
 - 6.2.5 The near field zone, Fresnel zone, and far field zone 234
 - 6.2.6 Geometric optics 236
- 6.3 Volume antennas 239
 - 6.3.1 Radiation from holes 239
 - 6.3.2 Field in narrow long slot 243
 - 6.3.3 Resonant antennas 245
 - 6.3.4 Transparency of short-periodical array 247
 - 6.3.5 Dielectric antennas 249
 - 6.3.6 The inverse problem for volume antennas 253
 - 6.3.7 Analytical continuation of the field 257
- 7 Diffraction on Metallic and Dielectric Objects 261**
 - 7.1 Diffraction of the plane wave on circular waveguide 261
 - 7.1.1 Scalar potentials 261
 - 7.1.2 The variable separation method: the Rayleigh series 262
 - 7.1.3 The Watson series 264
 - 7.1.4 Dielectric cylinder 269
 - 7.2 Diffraction on metallic half-plane 271
 - 7.2.1 Usage of the variable separation method 271
 - 7.2.2 Currents on metallic surface 273
 - 7.2.3 The far field 274
 - 7.3 The Debye potentials: diffraction on a metallic sphere 277
 - 7.3.1 The Debye potentials 277
 - 7.3.2 The Debye potentials for fields of elementary sources 278
 - 7.3.3 Fields of elementary sources located at point with complex coordinates 279
 - 7.3.4 Diffraction of the plane wave on metallic sphere: the Rayleigh series 281
 - 7.3.5 Small sphere: dipole momenta 284
 - 7.3.6 Large sphere: the Watson series 285
 - 7.4 Small bodies; large bodies 288
 - 7.4.1 Diffraction on the body with noncoordinate surface 288

- 7.4.2 Small metallic bodies 291
- 7.4.3 The duality principle for the hole in plain screen 294
- 7.4.4 Thin metallic cylinder of arbitrary cross-section: the *H*-polarization 298
- 7.4.5 Thin metallic cylinder of arbitrary cross-section: the *E*-polarization 300
- 7.4.6 The current on a metallic surface of small curvature 304
- 7.4.7 Ray structure of the field in shadow: geometro-optical theory of diffraction 306
- 7.4.8 The method of auxiliary sources 308
- 7.4.9 The optical theorem 312
- 7.4.10 Spectral method for the diffraction problems 316
