THE BIOCHEMICAL BASIS OF

Sports Performance

Ron Maughan • Michael Gleeson

Contents

Preface

x

1 Introduction: The biochemical basis of exercise and sport

Learning objectives	1
Introduction	1
Historical perspective	3
Evolution of records	3
The appliance of science	9
Key points	10

2 The weightlifter

Learning objectives	13
Introduction	14
Muscle structure and function	15
Types of muscle	15
Structure of skeletal muscle	15
Muscle fibre ultrastructure	17
Molecular composition of the thick and thin myofilaments	19
The contractile mechanism	19
Control of contraction	24
Motor units	24
Fibre types	28
Types of contraction	34
Eccentric exercise-induced muscle damage	34
Adaptive capacity of skeletal muscle	35
Proteins: structural and functional characteristics	36
Amino acids	37
Protein structure	38

Protein turnover	42
Anabolic hormones	44
Proteins as enzymes	46
Mechanisms of enzyme action and enzyme kinetics	46
Control of enzyme activity	52
Enzyme isoforms	52
Energy for muscle contraction	54
The role of ATP	54
Burning fuel to resynthesize ATP	56
Nutritional effects on strength training and performance	58
Protein needs	58
Supplements	59
Steroids	61
Key points	63
Selected further reading	65

3 The sprinter

Learning objectives	67
Introduction	68
Anaerobic metabolism	68
Phosphagen system	69
Metabolic response to very high-intensity exercise	75
ATP resynthesis from phosphocreatine breakdown	75
ATP resynthesis from glycogen metabolism	77
Phosphocreatine and glycogen breakdown in Type I and Type II fibres	78
Myokinase reaction	80
Loss of adenine nucleotides	81
The cellular energy charge and the adenylate pool	81
Causes of fatigue in sprinting	83
Post-exercise recovery: the resynthesis of phosphocreatine	84
Nutritional effects on sprint performance	86
Key points	87
Selected further reading	89

4 Middle distance events

Learning objectives	91
Introduction	91

Energy and oxygen cost of middle distance running	92
Glycolysis	95
Fuels for glycolysis	95
The glycolytic pathway	97
Regulation of glycolysis	99
Regeneration of NAD	102
Oxidative metabolism of carbohydrate	102
Fatigue mechanisms in middle distance events	104
Recovery after exercise	107
Nutritional effects on the performance of the middle distance athlete	110
Carbohydrate	110
Bicarbonate	112
Key points	113
Selected further reading	114

5 The endurance athlete

Learning objectives	115
Introduction	116
Energy supply	117
Aerobic power	118
Fractional utilization of aerobic capacity	118
Energy metabolism	121
Oxidation of carbohydrate	123
Fat as a fuel	125
Fat metabolism	126
β -Oxidation of fatty acids	130
The tricarboxylic acid cycle	131
The terminal respiratory system	132
Integration and regulation of fuel use	134
Factors affecting key enzymes	134
Regulation of energy metabolism by hormones	136
Fatigue in prolonged exercise	138
Nutrition and endurance exercise performance	140
Carbohydrate and protein	141
Caffeine and carnitine	143
Key points	145
Selected further reading	147

6 The games player

Learning objectives	149
Introduction	150
Activity patterns and work rate in games play	150
Metabolic responses to intermittent high-intensity exercise	152
Resynthesis of phosphocreatine	156
Why does the rate of lactate production fall with repeated sprints?	158
Fatigue in multiple sprint sports	160
Nutritional strategies for team sports athletes	164
Energy and carbohydrate needs	164
Creatine supplements and performance of multiple sprints	165
Key points	168
Selected further reading	169

7 Sporting talent: the genetic basis of athletic capability

Learning objectives	171
Introduction: factors determining success in sport	171
The nature of the genetic material	173
Nucleic acids and control of protein synthesis	173
Mutations	179
Principles of heredity	181
Inheritance of traits	181
Muscle fibre type composition: determined by nature or nurture?	185
Key points	187
Selected further reading	189

8 Adaptations to training

Learning objectives	191
Introduction	192
Training strategies and the associated adaptations	194
Training for strength	195
Training for speed	199
Training for middle distance: increasing anaerobic capacity	201
Training for endurance: increasing aerobic capacity	202

Mechanisms and limitations to adaptation	207
Overreaching and overtraining	209
Exercise training, immune function and susceptibility to infection	211
Acute effects of exercise on immune function	212
Chronic effects of exercise training on immune function	213
Effects of detraining	214
Nutritional effects on training adaptation	215
Training and diet	215
Nutrient-gene interactions	216
Free radicals and antioxidants	218
Key points	220
Selected further reading	221

Appendix 1 Key concepts in physical, organic and biological chemistry

Introduction	223
Matter, energy and atomic structure	223
Chemical bonds, free energy and ATP	227
Hydrogen ion concentration and buffers	230
Membrane structure and transport	232
Cells and organelles	236

Appendix 2 Glossary of abbreviations and biochemical terminology

Abbreviations	239
Biochemical terminology	243

Appendix 3 Units commonly used in biochemistry and physiology

Système international d'unités (SI units)	251
Derived SI units and non-SI units allowed or likely to be met	252
SI fractions and multiples	252
Index	253
