Deep Excavation

Theory and Practice

Chang-Yu Ou

Contents

Preface xv

1 Introduction to the analysis and design of excavations 1

1.1 Geological investigation and soil tests 1
1.2 Conditions of the adjacent properties 3
1.3 Confirmation of the conditions of an excavation site 3
1.4 Designing criteria 3
1.5 Collecting case histories of the nearby excavations 4
1.6 Auxiliary methods 4
1.7 Excavation analyses 4
1.8 Layout of the strutting system 4
1.9 Monitoring system 5
1.10 Protection of neighboring properties 5

2 Basic properties and mechanical characteristics of soils 7

2.1 Introduction 7
2.2 Basic properties 7
2.2.1 Specific gravity 8
2.2.2 Unit weight and water content 8
2.2.3 Atterberg limit 9
2.2.4 Permeability 11
2.3 Consolidation 11
2.4 Concept of effective stresses 14
2.5 Parameters of porewater pressure 16
2.6 Failure of soils 18
2.6.1 Mohr-Coulomb failure theory 18
2.6.2 Some commonly used laboratory shear strength tests 21
2.6.2.1 Triaxial test 22
2.6.2.2 Direct shear test 23
2.6.2.3 Direct simple shear test 24
2.6.3 Stress paths 25
2.7 Drained shear strength of soils 27

2.8 *Undrained shear strength of saturated cohesive soils* 29
2.8.1 Concepts of undrained shear strength 29
2.8.2 Characteristics of undrained shear strength 31
2.8.3 Methods to obtain undrained shear strength 34
2.8.3.1 Triaxial UU test 34
2.8.3.2 CU test 36
2.8.3.3 Field vane shear test 38
2.8.3.4 Cone penetration test 41
2.8.3.5 Other methods and empirical formulas 42
2.9 *Relationship between shear strength, volume change, and porewater pressure* 43
2.10 *Undrained shear strength of unsaturated cohesive soils* 49
2.11 *Soil properties at the TNEC site* 50
2.12 *Summary and general comments* 52

3 Excavation methods and lateral supporting systems 57

3.1 *Introduction* 57
3.2 *Excavation methods* 57
3.2.1 Full open cut methods 57
3.2.2 Braced excavation methods 58
3.2.3 Anchored excavation methods 60
3.2.4 Island excavation methods 63
3.2.5 Top-down construction methods 65
3.2.6 Zoned excavation methods 67
3.3 *Retaining walls* 67
3.3.1 Soldier piles 67
3.3.2 Sheet piles 70
3.3.3 Column piles 71
3.3.4 Diaphragm walls 76
3.4 *Strutting systems* 80
3.5 *Selection of the retaining strut system* 83
3.6 *Case history of the TNEC excavation* 84
3.7 *Summary and general comments* 88

4 Lateral earth pressure 91

4.1 *Introduction* 91
4.2 *Lateral earth pressure at rest* 91
4.3 *Rankine's earth pressure theory* 92
4.4 *Coulomb's earth pressure theory* 97
4.5 *General discussion of various earth pressure theories* 99
4.5.1 Displacement and earth pressure 99
4.5.2 Comparisons of Rankine's and Coulomb's earth pressure theories 99
4.5.3 Reliability of earth pressure theories and other solutions 100

4.6 *Earth pressure for design* 105
4.6.1 Cohesive soils 105
4.6.2 Cohesionless soils 108
4.6.3 Alternated layers 109
4.6.4 Sloping ground 109
4.6.5 Surcharge 111
4.6.6 Seepage 115
4.6.7 Earthquakes 117
4.7 *Summary and general comments* 119

5 Stability analysis 125

5.1 *Introduction* 125
5.2 *Types of factors of safety* 125
5.3 *Overall shear failure* 126
5.4 *Free earth support method and fixed earth support method* 127
5.5 *Overall shear failure of strutted walls* 129
5.5.1 Push-in 129
5.5.2 Basal heave 134
5.5.2.1 *Bearing capacity method* 135
5.5.2.2 *Negative bearing capacity method* 139
5.5.2.3 *Slip circle method* 141
5.5.2.4 *Comparisons of the various analysis methods for basal heave failure* 145
5.5.2.5 *Applicability to sandy soils* 146
5.5.3 Case study of overall shear failure 146
5.6 *Overall shear failure of cantilever walls* 154
5.7 *Upheaval* 162
5.8 *Sand boiling* 163
5.8.1 Mechanism and factors of safety 163
5.8.2 Case study 168
5.9 *Summary and general comments* 170

6 Stress and deformation analysis: simplified method 179

6.1 *Introduction* 179
6.2 *Analysis of settlement induced by the construction of diaphragm walls* 180
6.3 *Characteristics of wall movement induced by excavation* 182
6.3.1 Safety factors of stability 183
6.3.2 Excavation width 183
6.3.3 Excavation depth 184
6.3.4 Wall penetration depth 184
6.3.5 Wall stiffness 185
6.3.6 Strut stiffness 185
6.3.7 Strut spacing 187
6.3.8 Strut preload 188

6.4 *Characteristics of ground movement induced by excavation* 188
6.4.1 Shapes and types of ground surface settlement 189
6.4.2 Influence zones of settlement 190
6.4.3 Locations of the maximum settlement 193
6.4.4 Magnitude of the maximum settlement 193
6.4.5 Relationships between ground surface settlements and soil movements 194
6.5 *Characteristics of excavation bottom movement induced by excavation* 195
6.6 *Time dependent movement* 197
6.7 *Analysis of wall deformations induced by excavation* 200
6.8 *Analysis of ground surface settlements induced by excavation* 200
6.8.1 Peck's method 201
6.8.2 Bowles's method 202
6.8.3 Clough and O'Rourke's method 203
6.8.4 Ou and Hsieh's method 203
6.8.5 Comparison of the various analysis methods 205
6.9 *Three-dimensional excavation behavior* 208
6.10 *Stress analysis* 209
6.10.1 Struts—the apparent earth pressure method 209
6.10.2 Cantilevered walls—the simplified gross pressure method 214
6.10.3 Strutted walls—the assumed support method 215
6.10.3.1 Distribution of lateral earth pressure 216
6.10.3.2 Location of the assumed support 216
6.10.3.3 Computation procedure 217
6.11 *Summary and general comments* 226

7 Stress and deformation analysis: beam on elastic foundation method 235

7.1 *Introduction* 235
7.2 *Basic principles* 236
7.3 *Formulation* 238
7.4 *Distribution of lateral earth pressures* 243
7.5 *Estimation of coefficient of subgrade reaction* 245
7.6 *Estimation of structural parameters* 248
7.7 *Analysis methods for excavations* 250
7.7.1 Direct analysis and back analysis 250
7.7.2 Drained analysis, undrained analysis, and partially drained analysis 251
7.8 *Computation of ground surface settlement* 252
7.9 *Limitations of the beam on elastic foundation method* 253
7.10 *Application of computer programs* 253
7.10.1 Confirmation of the type of stress used in computer programs 254
7.10.2 Application of the computer program coded on the sole basis of the effective stress 255

7.10.3 Application of the computer program coded on the double basis of effective and total stresses 259
7.10.4 Confirmation of the type of earth pressure theory built into computer programs 259
7.10.5 Verification through case histories 259
7.11 Summary and general comments 262

8 Stress and deformation analysis: finite element method 269

8.1 Introduction 269
8.2 Basic principles 270
8.2.1 Plane strain elements 274
8.2.2 Bar elements 275
8.2.3 Beam elements 276
8.2.4 Interface elements 276
8.3 Stress-strain relationship and constitutive laws of soils 277
8.3.1 Elastic incremental model—the hyperbolic model 277
8.3.2 Linear elastic elastoplastic model 281
8.3.3 Cam-clay model and other high order models 284
8.4 Stress-strain relationship of structural materials and structural models 287
8.5 Determination of initial stresses 288
8.5.1 Direct input method 289
8.5.2 Gravity generation method 290
8.6 Modeling of an excavation process 291
8.7 Mesh generation 292
8.7.1 Shape of the element 292
8.7.2 Density of mesh 293
8.7.3 Boundary conditions 293
8.8 Excavation analysis method 296
8.8.1 Direct analysis and back analysis 296
8.8.2 Total stress analysis and effective stress analysis 296
8.8.3 Drained analysis, undrained analysis, and partially drained analysis 297
8.8.4 Coupled analysis 297
8.8.5 Plane strain analysis and three-dimensional analysis 298
8.9 Determination of soil parameters 299
8.9.1 Parameters for elastic deformation 299
8.9.2 Parameters for the hyperbolic model 300
8.9.3 Parameters for the linear elastic elastoplastic model 302
8.9.4 Parameters for the Cam-clay model and other high order models 303
8.10 Determination of structural parameters 305
8.11 Discussion of accuracy of analysis results 305
8.12 Summary and general comments 307

9 Dewatering of excavations 313

9.1 Introduction 313
9.2 Goals of dewatering 314
9.3 Methods of dewatering 316
9.3.1 Open sumps or ditches 316
9.3.2 Deep wells 318
9.3.3 Well points 319
9.4 Well theory 322
9.4.1 Confined aquifers 322
9.4.1.1 Full penetration wells 322
9.4.1.2 Partial penetration well 331
9.4.2 Free aquifers 331
9.4.2.1 Full penetration well 332
9.4.2.2 Partial penetration well 334
9.4.3 Group wells 334
9.5 Pumping tests 336
9.5.1 Step drawdown tests 336
9.5.2 Constant rate tests 337
9.5.2.1 Confined aquifers 337
9.5.2.2 Free aquifers 339
9.6 Dewatering plan for an excavation 340
9.6.1 Selection of dewatering methods 340
9.6.2 Determination of hydraulic parameters 340
9.6.3 Determination of the capacity of wells 341
9.6.4 Estimation of the number of wells 342
9.6.5 Computation of the influence range of drawdown 344
9.7 Dewatering and ground settlement 346
9.8 Summary and general comments 357

10 Design of retaining structural components 361

10.1 Introduction 361
10.2 Design methods and factors of safety 361
10.3 Retaining walls 362
10.3.1 Soldier piles 363
10.3.2 Sheet piles 364
10.3.3 Column piles 365
10.3.4 Diaphragm walls 365
10.3.4.1 Vertical main reinforcement 367
10.3.4.2 Horizontal main reinforcement 369
10.3.4.3 Shear reinforcement 369
10.3.4.4 Lap splice length and development length 371
10.4 Structural components in braced excavations 372

10.5 *Strut systems* 375
10.5.1 Horizontal struts 375
10.5.1.1 Stress computation 375
10.5.1.2 Allowable stress 376
10.5.1.3 Examination of combined stresses 378
10.5.2 End braces and corner braces 378
10.5.3 Wales 379
10.5.4 Center posts 381
10.5.4.1 Vertical bearing capacity 385
10.5.4.2 Pullout resistance 386
10.6 *Structural components in anchored excavations* 386
10.7 *Anchor systems* 387
10.7.1 Components of anchors 387
10.7.2 Analysis of anchor load 389
10.7.3 Arrangement of anchors 390
10.7.4 Design of anchor heads, anchor stands, and wales 392
10.7.5 Design of the free section 395
10.7.6 Design of the fixed section 396
10.7.6.1 Friction type of anchor 397
10.7.6.2 Underreamed anchors 399
10.7.7 Preloading 399
10.7.8 Design of retaining walls 400
10.8 *Tests of anchors* 400
10.8.1 Proving test 400
10.8.2 Suitability test 403
10.8.3 Acceptance test 403
10.9 *Summary and general comments* 404

11 Excavation and protection of adjacent buildings 409

11.1 *Introduction* 409
11.2 *Allowable settlement of buildings* 410
11.2.1 Allowable settlement under the building weight 410
11.2.2 Excavation-induced allowable settlement 413
11.3 *Introduction to soil improvement methods* 415
11.3.1 Chemical grouting method 415
11.3.2 Jet grouting method 417
11.3.3 Deep mixing method 419
11.3.4 Compaction grouting method 419
11.4 *Building protection using the characteristics of excavation-induced deformation* 420
11.4.1 Reduce the unsupported length of the retaining wall 420
11.4.2 Decrease the influence of creep 421

11.4.3	Take advantage of corner effect	422
11.4.4	Take advantage of the characteristics of ground settlement	422
11.5	*Building protection by increasing stiffness of the retaining-strut system*	425
11.6	*Building protection by utilizing auxiliary methods*	426
11.6.1	Ground improvement	426
11.6.2	Counterfort walls	430
11.6.3	Cross walls	434
11.6.4	Micro piles	438
11.6.5	Underpinning	439
11.7	*Construction defects and remedial measures*	444
11.7.1	Leakage through the retaining wall	444
11.7.2	Dewatering during excavation	446
11.7.3	Construction of the retaining wall	447
11.7.4	Pulling out the used piles	447
11.7.5	Over-excavation	448
11.8	*Building rectification methods*	448
11.8.1	Compaction grouting	448
11.8.2	Chemical grouting	451
11.8.3	Underpinning	452
11.9	*Summary and general comments*	454
12	**Monitoring systems**	459
12.1	*Introduction*	459
12.2	*Elements of a monitoring system*	460
12.3	*Principles of strain gauges*	461
12.3.1	Wire resistant type of strain gauges	461
12.3.2	Vibrating type of strain gauges	465
12.4	*Measurement of movement and tilt*	467
12.4.1	Lateral deformation of retaining walls and soils	467
12.4.2	Tilt of buildings	474
12.4.3	Ground settlement and building settlement	476
12.4.4	Heave of excavation bottoms	477
12.5	*Measurement of stress and force*	479
12.5.1	Strut load	479
12.5.2	Stress of the retaining wall	481
12.5.3	Earth pressure on the retaining wall	483
12.6	*Measurement of water pressure and groundwater level*	487
12.6.1	Water pressure	487
12.6.2	Groundwater level	490
12.7	*Other measurement objects*	491
12.8	*Plan of monitoring systems*	492
12.9	*Application of monitoring systems*	493
12.10	*Summary and general comments*	498

Appendix A Conversion factors 503

A.1 Length 503
A.2 Area 504
A.3 Volume or section modulus 504
A.4 Moment of inertia 504
A.5 Mass 505
A.6 Density 505
A.7 Force or weight 505
A.8 Stress or pressure 506
A.9 Unit weight 506

Appendix B Indices of the case histories: TNEC and buildings P, Q, R, and S 507

B.1 TNEC 507
B.2 Building P 507
B.3 Building Q 508
B.4 Building R 508
B.5 Building S 508

Appendix C Commonly used steel sections or piles 509

C.1 H-steel (or W-section) 509
C.2 I-section 510
C.3 U-section sheet piles 510
C.4 Z-section sheet piles 510
C.5 Line-section sheet piles 511
C.6 Rail piles 511

Appendix D Definition of plane strain 513

Answers to selected problems 515
References 519
