Abbreviations	viii
Preface	ix
1 Basic Principles of Gene Transfer	1
1.1 Introduction	1
1.2 Historical perspective and some definitions	1
1.3 Stages of gene transfer and the fate of exogenous nucleic acid	6
1.4 Monitoring gene transfer: reporter genes	8
1.5 Selectable markers for the stable transformation of animal cells	13
1.6 Modification of the endogenous genome	17
2 Chemical and Physical Transfection	19
2.1 Introduction	19
2.2 Chemical transfection methods	20
2.3 Physical transfection methods	28
2.4 Plasmid vector systems for transient transfection	34
2.5 Episomal stable transformation systems	36
Protocol 2.1: Transfection of adherent cells using calcium phosphate (HEPES method)	42
Protocol 2.2: Transfection of adherent cells using calcium phosphate (BES method)	44
Protocol 2.3: Transfection of mammalian cells using LipofectAMINE 2000	45
Protocol 2.4: Electroporation of mammalian cells	47
3 Cell-mediated Gene Transfer	49
3.1 Introduction	49
3.2 Cells as active gene transfer vectors	50
3.3 Cells as passive transfer vehicles for gene transfer	54
4 Gene Transfer Using Viral Vectors	59
4.1 Introduction	59
4.2 Gene delivery with adenovirus vectors	64
4.3 Gene delivery with adeno-associated virus vectors	70
4.4 Gene delivery with alphavirus vectors	73
4.5 Gene delivery with baculovirus vectors	78
4.6 Gene delivery with herpesvirus vectors	83
4.7 Gene delivery with retrovirus vectors	87

4.8	Gene delivery with poxvirus vectors	93
4.9	Hybrid viral vectors	96
	Protocol 4.1: Transduction of cultured cells with E1-replacement adenovirus vectors	100
	Protocol 4.2: Transduction of cultured cells with MLV-based retroviral vectors	102
5	Genetic Manipulation of Animals	105
5.1	Introduction	105
5.2	Historical perspective – of mice and frogs.... and flies	107
5.3	Standard methods for the production of transgenic mice	108
5.4	Further methods for mammalian and avian transgenesis	112
5.5	Mitochondrial transgenics and electrofusion	114
5.6	Nuclear transfer technology	116
5.7	Transgenic frogs	119
5.8	Transgenic fish	120
5.9	Transgenic insects and worms	121
	Protocol 5.1: Preparation of vasectomized male mice	129
	Protocol 5.2: Superovulation of immature females	130
	Protocol 5.3: Collection of fertilized eggs	131
	Protocol 5.4: Pronuclear microinjection	132
	Protocol 5.5: Transfer of injected eggs into foster females	133
6	Gene Targeting in Animal Cells	135
6.1	Introduction	135
6.2	History of gene targeting by homologous recombination in mammalian cells	136
6.3	Target cells for homologous recombination	137
6.4	Design of targeting vectors	138
6.5	Selection strategies	140
6.6	Introducing point mutations by gene targeting	141
6.7	Gene targeting in mice	142
6.8	Enhancing the efficiency of gene targeting	145
6.9	Gene targeting in domestic mammals	146
6.10	Gene targeting in humans	147
6.11	Site-specific recombination	148
6.12	Applications of site-specific recombination	148
6.13	Conditional mutagenesis in mice	151
6.14	Gene targeting in <i>Drosophila</i>	153
	Protocol 6.1: Electroporation of murine ES cells with G418 selection	159
	Protocol 6.2: Picking targeted colonies	161
	Protocol 6.3: Blastocyst injection	162
7	Control of Transgene Expression	163
7.1	Introduction	163
7.2	Classes of expression vector	163
7.3	Components of protein expression constructs	165

7.4	Transcriptional initiation: promoters and enhancers	167
7.5	Transcriptional termination and RNA processing	179
7.6	Protein synthesis	183
7.7	Post-translational events	185
7.8	Inducible protein activity	187
8	Transgene Behavior	191
8.1	Introduction	191
8.2	Timing of transgene integration	192
8.3	The fate of foreign DNA and the structure of the transgenome	193
8.4	Position effects	194
8.5	Integration effects	196
8.6	Transgene copy number and dosage effects	197
8.7	Transgene organization	198
8.8	Transgene silencing	199
8.9	Other problems with transgene expression	201
8.10	Overcoming position effects	202
9	Additional Strategies for Gene Inactivation	205
9.1	Introduction	205
9.2	Gene inactivation at the DNA level – insertional mutagenesis	206
9.3	Entrapment vectors	207
9.4	RNA-based strategies for transgene inactivation	213
9.5	Gene inhibition at the protein level	219
	Protocol 9.1: <i>In vitro</i> synthesis of dsRNA	225
	Protocol 9.2: Transfection of mammalian cells with siRNA	227
10	Applications of Gene Transfer in Animals	229
10.1	Introduction	229
10.2	Gene transfer for the functional analysis of individual genes	229
10.3	Gene transfer for the study of gene regulation	231
10.4	Applications of gene transfer in functional genomics	232
10.5	The production of recombinant therapeutic proteins	234
10.6	Disease models	234
10.7	Improvement of livestock traits	236
10.8	The production of human-compatible tissues for transplantation	237
10.9	Gene medicine	238
