Manual of Exercise Testing

Third Edition

MOSBY
ELSEVIER

Contents

1. The Physiologic Response to the Exercise Test	1
Introduction	1
Basic Principles	1
Concepts of Work	3
Energy and Muscular Contraction	4
Muscle Fiber Types	5
Acute Cardiopulmonary Response to Exercise	6
Autonomic Control	11
Summary	13
2. Methods	17
Introduction	17
Safety Precautions and Risks	18
Legal Concerns	21

Patient Preparation	22
History and Physical Examination	24
Blood Pressure Measurement	25
ECG Recording	26
Exercise Test Modalities	34
Exercise Protocols	36
Borg Scale	39
Postexercise Period	42
Add-Ons	42
Summary	46
3. Interpretation of Hemodynamic Responses to Exercise Testing	51
Introduction	51
Exercise Capacity Versus Functional Classification	51
Maximal Cardiac Output	62
Normal Heart Rate and Blood Pressure Values	64
Maximal Heart Rate	64
Heart Rate Recovery	72
Blood Pressure Response	74
Summary	80
4. Interpretation of the Electrocardiogram	87
Introduction	87
Studies of the Electrocardiographic Response to Exercise	87
Controversial ECG Responses to Exercise	90

Abnormal ST-Segment Changes	93
Chest Pain	113
Interpretation of Exercise Test–Induced Arrhythmias	117
Observer Agreement in Interpretation	130
Summary	132
5. Diagnostic Applications of Exercise Testing	143
Introduction	143
Diagnostic Test Performance Definitions	143
Diagnostic Endpoints	149
Electrocardiogram Criteria	151
Influence of Other Factors on Test Performance	153
Meta-Analysis of Exercise Testing Studies	156
Multivariable Techniques to Diagnose Angiographic Coronary Disease	159
Exercise Test Scores	161
ACC/AHA Guidelines for the Diagnostic Use of the Standard Exercise Test	165
Immediate Management of Acute Coronary Syndrome Patients	166
Summary	167
6. Prognostic Applications of Exercise Testing	175
Rationale	175
Statistical Methods Used for Survival Analysis	176
Prediction of High Risk or Poor Prognosis in Patients with Stable Coronary Heart Disease	178

Comparison of Prediction Equations with Cardiologists' Predictions	200
ACC/AHA Guidelines for the Prognostic Use of the Standard Exercise Test	202
Summary	203
7. Exercise Testing of Patients with Left Ventricular Dysfunction	211
Pathophysiology	211
Prevalence and Prognosis in Heart Failure	212
Evaluation of Therapies for Heart Failure	228
Summary	228
8. Exercise Testing of Patients Recovering from Myocardial Infarction	239
Introduction	239
American College of Cardiology/American Heart Association Exercise Testing Guidelines: Recommendations for Exercise Testing after Myocardial Infarction	241
Methodologic Studies	243
Results of Exercise Testing and Coronary Angiography following Myocardial Infarction	244
Prognostic Studies	244
The Reperfusion Era	251
Activity Counseling	253
Summary	254
9. Screening Apparently Healthy Individuals	261
Introduction	261
Prevention of Coronary Artery Disease	262
Test Performance	264

The Resting Electrocardiogram as a Screening Technique	265
Recommendations from the American College of Cardiology/American Heart Association Guidelines Regarding Exercise Testing as a Screening Procedure	268
Follow-Up Studies That Have Used a Screening Exercise Test	273
Exercise Testing and Coronary Angiography in Asymptomatic Populations	279
Techniques to Improve Screening	281
Multivariable Prediction Techniques with Exercise Testing for Screening	283
Exercise Testing for Special Screening Purposes	286
EBCT for Screening Asymptomatic Subjects	289
Does Screening Motivate Patients to Alter Their Risk?	290
Summary	291
10. Case Examples	301
Case One: Failure of CABS and PCI to Normalize Exercise-Induced ST Depression	301
Case Two: False-Positive ST Depression	307
Case Three: Left Main Obstruction	308
Case Four: Exertional Hypotension	311
Case Five: ST Depression with Persantine	314
Case Six: Abnormal Screening Treadmill Test	319
Case Seven: Pre-/Post-CABG	324
Case Eight: Pre-/Post-PCI	330
Case Nine: Exercise-Induced ST Elevation	334
Case Ten: ST Depression and Ventricular Tachycardia	338
Index	343
