

The background of the book cover is a complex, abstract illustration of molecular structures. It features a dense network of blue and grey spheres connected by thin lines, representing atoms and bonds. Interspersed among these are larger, more solid-looking structures in shades of red, orange, and purple, which could represent proteins or other biological molecules. The overall color palette is dominated by these warm, vibrant hues against a dark, almost black background, creating a sense of depth and scientific complexity.

Medical Biochemistry at a Glance

Second Edition

J. G. SALWAY

Contents

Preface	7
Acknowledgements	9
Figure Key	10
Mass Unit SI Unit Conversions	11
1 Acids, bases and hydrogen ions (protons)	12
2 Understanding pH	14
3 Production and removal of protons into and from the blood	16
4 Metabolic alkalosis and metabolic acidosis	18
5 Respiratory alkalosis and respiratory acidosis	20
6 Amino acids and the primary structure of proteins	22
7 Secondary structure of proteins	24
8 Tertiary and quaternary structures and collagen	26
9 Enzymes: nomenclature, kinetics and inhibitors	28
10 Regulation of enzyme activity	30
11 Carbohydrates	32
12 Absorption of carbohydrates and metabolism of galactose	34
13 Oxidation/reduction reactions, coenzymes and prosthetic groups	36
14 Anaerobic production of ATP by substrate-level phosphorylation, phosphocreatine and adenylate kinase reaction	38
15 Aerobic production of ATP	40
16 Biosynthesis of ATP by oxidative phosphorylation I	42
17 Biosynthesis of ATP by oxidative phosphorylation II	44
18 What happens when protons or electrons leak from the respiratory chain?	46
19 Free radicals, reactive oxygen species and oxidative damage	48
20 Aerobic oxidation of glucose to provide energy as ATP	50
21 Anaerobic oxidation of glucose by glycolysis to form ATP and lactate	52
22 Anaerobic glycolysis in red blood cells, 2,3-BPG and the Bohr effect	54
23 The fate of glucose in liver: glycogenesis and lipogenesis	56
24 Fructose metabolism	58
25 Glucose homeostasis	60
26 Glucose-stimulated secretion of insulin from β -cells	62
27 Regulation of glycogen metabolism	64
28 Glycogen breakdown (glycogenolysis) and glycogen storage diseases	66
29 Insulin signal transduction and diabetes mellitus	68
30 Regulation of glycolysis and Krebs cycle	70
31 Oxidation of fatty acids to produce ATP in muscle and ketone bodies in liver	72
32 Regulation of lipolysis, β -oxidation, ketogenesis and gluconeogenesis	74
33 Diabetes mellitus	76
34 Alcohol metabolism: hypoglycaemia, hyperlactataemia and steatosis	78
35 Structure of lipids	80
36 Phospholipids I: phospholipids and sphingolipids	82
37 Phospholipids II: micelles, liposomes, lipoproteins and membranes	84
38 Metabolism of carbohydrate and fat to cholesterol	86
39 VLDL and LDL metabolism ("forward" cholesterol transport)	88
40 VLDL and LDL metabolism (endogenous triacylglycerol transport)	90
41 HDL metabolism ("reverse" cholesterol transport)	92
42 Absorption and disposal of dietary triacylglycerol, and cholesterol by chylomicrons	94
43 Steroid hormones: aldosterone, cortisol, androgens and oestrogens	96
44 Urea cycle and overview of amino acid catabolism	98
45 Non-essential and essential amino acids	100
46 Amino acid metabolism: to energy as ATP; to glucose and ketone bodies	102
47 Amino acid disorders: maple syrup urine disease, homocystinuria, cystinuria, alkaptonuria and albinism	104
48 Phenylalanine and tyrosine metabolism in health and disease	106
49 The products of tryptophan and histidine metabolism	108
50 Pyrimidine metabolism	110
51 Purine metabolism	112
52 Haem, bilirubin and porphyria	114
53 Fat-soluble vitamins I: vitamins A and D	116
54 Fat-soluble vitamins II: vitamins E and K	118
55 Water-soluble vitamins I: thiamin, riboflavin, niacin and pantothenate	120
56 Water-soluble vitamins II: pyridoxal phosphate (B_6)	122
57 Water-soluble vitamins III: folate and vitamin B_{12}	124
58 Water-soluble vitamins IV: biotin and vitamin C	126
59 Diagnostic clinical chemistry	128
Index	130
