<b>1 Introduction</b>	<b>1</b>
1.1 Twenty years of development at EDF . . . . .	1
1.2 Some smoother pebbles... . . . .	3
1.2.1 Saint-Venant equations . . . . .	3
1.2.2 Navier–Stokes equations . . . . .	3
1.2.3 Finite element techniques and optimization . . . . .	4
<b>2 Equations of free surface hydrodynamics</b>	<b>5</b>
2.1 Notations and concepts in geometry . . . . .	5
2.2 Free surface Navier–Stokes equations . . . . .	7
2.2.1 Non-hydrostatic Navier–Stokes equations . . . . .	7
2.2.2 Boundary conditions . . . . .	9
2.2.3 Hydrostatic pressure and the Boussinesq approximation . . . . .	11
2.2.4 Source terms and body forces . . . . .	13
2.2.5 Navier–Stokes equations with sigma transform . . . . .	18
2.2.6 Tracer equations in 3 dimensions . . . . .	23
2.3 Saint-Venant equations . . . . .	24
2.3.1 Presentation and brief review . . . . .	24
2.3.2 Hypotheses, approximations and calculation rules . . . . .	25
2.3.3 Depth-averaging Navier–Stokes equations . . . . .	27
2.3.4 Different forms of equations . . . . .	31
2.3.5 The characteristic curves . . . . .	35
2.3.6 Notions on hydraulic jumps . . . . .	36
2.3.7 Saint-Venant equations in Mercator projection . . . . .	39
2.3.8 Saint-Venant equations with porosity . . . . .	43
2.3.9 Boussinesq equations . . . . .	44
2.3.10 Serre equations . . . . .	45
2.3.11 Source terms and body forces in two dimensions . . . . .	49

2.3.12	Boundary conditions in 2D . . . . .	58
2.3.13	Tracer equation in two dimensions . . . . .	60
2.4	Modelling of turbulence and dispersion . . . . .	61
2.4.1	Reynolds stress . . . . .	61
2.4.2	Zero-equation models . . . . .	63
2.4.3	Turbulence stress on the walls . . . . .	68
2.4.4	Equations of the $k-\varepsilon$ model . . . . .	70
2.4.5	Other models . . . . .	75
<b>3</b>	<b>Principles of the finite element method</b>	<b>77</b>
3.1	Introduction . . . . .	77
3.2	Interpolation in finite elements . . . . .	78
3.3	Variational principle . . . . .	80
<b>4</b>	<b>Resolution of the Saint-Venant equations</b>	<b>83</b>
4.1	A glance at the existing methods . . . . .	83
4.1.1	Main properties of a (good) numerical scheme . . . . .	84
4.1.2	Finite difference schemes . . . . .	85
4.1.3	Finite volume schemes for hyperbolic equations . . . . .	87
4.1.4	Kinetic schemes . . . . .	88
4.1.5	Finite element schemes . . . . .	89
4.2	Overall view of the Telemac-2D algorithm . . . . .	89
4.3	Fractional steps method . . . . .	90
4.4	Advection stage using the method of characteristics . . . . .	91
4.5	Propagation, diffusion, source terms . . . . .	92
4.5.1	Time discretization . . . . .	92
4.5.2	Space discretization . . . . .	95
4.5.3	Variational formulation . . . . .	95
4.5.4	Natural boundary conditions . . . . .	99
4.5.5	Sources and sinks . . . . .	101
4.5.6	Matrix form of the system . . . . .	102
4.6	Radiation conditions . . . . .	105
4.7	Resolution of the Boussinesq equations . . . . .	108
4.8	Resolution of $k-\varepsilon$ model equations in 2D . . . . .	111
4.8.1	Advection step . . . . .	111
4.8.2	Production, diffusion, source terms . . . . .	111
4.9	Solving the tracer equation in 2D . . . . .	113
4.10	Laws of conservation in 2D . . . . .	113
4.10.1	Mass conservation of the fluid . . . . .	114
4.10.2	Conservation of the tracer . . . . .	115
4.10.3	Head and momentum conservation . . . . .	116
4.10.4	Conservation of energy . . . . .	118
4.11	The treatment of uncovered beds . . . . .	121
4.11.1	Option 1: correction of the free surface gradient . . . . .	122
4.11.2	Option 2: masking of exposed elements . . . . .	123
4.12	Pseudo wave equation . . . . .	123
4.13	Some validation test cases . . . . .	128

4.13.1	<i>Test of a lake at rest</i>	128
4.13.2	<i>Rapid flow over a weir with a hydraulic jump downstream</i>	128
4.13.3	<i>Wave propagation</i>	129
4.13.4	<i>Ritter and Stoker solutions</i>	130
<b>5</b>	<b>Resolution of the Navier–Stokes equations</b>	<b>133</b>
5.1	<i>Introduction</i>	133
5.2	<i>Equations with hydrostatic hypothesis</i>	136
5.2.1	<i>Fractional steps method</i>	136
5.2.2	<i>Spatial discretization</i>	137
5.2.3	<i>Building the three-dimensional mesh</i>	137
5.2.4	<i>Sigma transform and generalized sigma transform</i>	140
5.2.5	<i>Advection step</i>	141
5.2.6	<i>Diffusion step</i>	143
5.2.7	<i>Pressure–continuity step</i>	146
5.3	<i>Non-hydrostatic Navier–Stokes equations</i>	155
5.3.1	<i>Hydrostatic step</i>	156
5.3.2	<i>Continuity step</i>	157
5.3.3	<i>Calculation of free surface</i>	158
5.4	<i>Pseudo wave equation, a variant of the hydrostatic step</i>	158
5.4.1	<i>With explicit diffusion</i>	158
5.4.2	<i>With implicit diffusion?</i>	164

<b>7 Modern techniques in finite elements</b>	<b>195</b>
7.1 Description of finite elements . . . . .	195
7.1.1 Triangle with linear interpolation . . . . .	195
7.1.2 Quasi-bubble triangle . . . . .	195
7.1.3 Tetrahedron . . . . .	196
7.1.4 Prism . . . . .	196
7.2 Mesh description . . . . .	199
7.2.1 Two-dimensional mesh . . . . .	199
7.2.2 Three-dimensional mesh . . . . .	201
7.3 Matrix storage . . . . .	202
7.3.1 Diagonal storage . . . . .	202
7.3.2 Compressed Sparse Row . . . . .	203
7.3.3 EBE storage . . . . .	203
7.3.4 Edge-based storage . . . . .	205
7.4 Operations on matrices . . . . .	206
7.4.1 Building the matrices . . . . .	207
7.4.2 Assembling a matrix for edge-based storage . . . . .	215
7.4.3 Assembly of an elementary vector . . . . .	216
7.4.4 Product of a non-symmetric EBE matrix and a vector . . . . .	219
7.4.5 Product of a symmetric EBE matrix and a vector . . . . .	220
7.4.6 Product of a transposed EBE matrix and a vector . . . . .	220
7.4.7 Processing of the Dirichlet boundary conditions . . . . .	220
7.4.8 Products between a diagonal matrix and a matrix . . . . .	221
7.4.9 Matrix–vector product with edge-based storage . . . . .	222
7.4.10 Matrix–vector frontal product . . . . .	223
7.5 Linear system resolution . . . . .	224
7.6 Methods of descent and preconditioning . . . . .	224
7.6.1 Conjugate gradient method . . . . .	226
7.6.2 Conjugate residual method . . . . .	227
7.6.3 Conjugate gradient on the normal equation . . . . .	228
7.6.4 Minimum error method . . . . .	229
7.6.5 GMRES method . . . . .	230
7.7 Preconditioning . . . . .	234
7.7.1 Diagonal preconditioning . . . . .	234
7.7.2 $c-u$ preconditioning for the Saint-Venant equations . . . . .	235
7.7.3 Block diagonal preconditioning . . . . .	236
7.7.4 Preconditioning with $LU$ factorization . . . . .	240
7.7.5 Crout preconditioning . . . . .	241
7.7.6 Gauss–Seidel EBE preconditioning . . . . .	245
7.7.7 Crout and Gauss–Seidel preconditioning for edge-based storage	245
<b>8 Parallelism</b>	<b>247</b>
8.1 Introduction . . . . .	247
8.2 Partition of the domain . . . . .	248
8.3 Requested data . . . . .	250
8.4 Communication between processors . . . . .	250
8.4.1 Point-to-point communication . . . . .	251

8.4.2	Collective communication . . . . .	251
8.4.3	Parallelism library . . . . .	251
8.5	Adaptation of the algorithms . . . . .	252
8.5.1	Data structure specific to parallelism . . . . .	252
8.5.2	Scalar product . . . . .	252
8.5.3	Matrix–vector product . . . . .	253
8.5.4	Specific cases . . . . .	254
8.6	Results . . . . .	255
8.6.1	Cluster of workstations HP9000/712/80 . . . . .	255
8.6.2	CRAY T3E . . . . .	256
8.6.3	Origin 2400, 64-bit IRIX 6.5.11m . . . . .	256
<b>9</b>	<b>Parameter estimation</b>	<b>257</b>
9.1	Introduction . . . . .	257
9.2	Principle of the adjoint method . . . . .	257
9.3	Treatment of Dirichlet conditions . . . . .	264
9.4	Application to Telemac-2D algorithm . . . . .	267
9.4.1	Friction coefficient estimation in Telemac-2D . . . . .	267
9.4.2	Calculation of right-hand sides of adjoint systems . . . . .	268
9.5	Descent methods for minimizing the cost function . . . . .	278
9.5.1	Conjugate gradient . . . . .	278
9.6	Validation and results . . . . .	279
<b>10</b>	<b>Applications</b>	<b>281</b>
10.1	Malpasset dam-break wave . . . . .	281
10.1.1	Introduction . . . . .	281
10.1.2	The Malpasset dam accident . . . . .	281
10.1.3	Available data . . . . .	282
10.1.4	Two-dimensional numerical modelling . . . . .	283
10.1.5	Results . . . . .	286
10.1.6	Performances on various machines . . . . .	286
10.1.7	More recent results . . . . .	287
10.1.8	Conclusion . . . . .	288
10.2	Tides in the English Channel and the Atlantic Ocean . . . . .	288
10.2.1	Estimation with adjoint method . . . . .	288
10.2.2	Estimation with surrogate models, neural networks and genetic algorithms . . . . .	290
10.3	Solitary wave . . . . .	294
10.4	Flow of two fluids of different densities . . . . .	297
<b>Appendix A</b>	<b>Tide-generating force</b>	<b>299</b>
A.1	Oceanic static tide . . . . .	300
A.1.1	Potential depending on the geocentric zenith distance . . . . .	300
A.1.2	Potential depending on the latitude, declination and hour angle . . . . .	303
A.1.3	Decomposition of hour angle, sidereal time . . . . .	307
A.2	Movement of the moon . . . . .	309
A.2.1	Mass of the moon . . . . .	310
A.2.2	Distance to the Earth, longitude of the moon in its orbit . . . . .	310

x CONTENTS

A.2.3 Declination and right ascension . . . . .	313
A.3 Movement of the sun . . . . .	314
A.3.1 Mass of the sun . . . . .	315
A.3.2 Distance to the Earth, longitude of the sun . . . . .	315
A.3.3 Declination and right ascension of the sun . . . . .	315
<b>Appendix B Diffusion matrix with tetrahedra</b>	<b>317</b>
<b>Appendix C Notations</b>	<b>321</b>
C.1 Latin alphabet . . . . .	321
C.2 Greek alphabet . . . . .	322
C.3 Mathematical signs . . . . .	323
