

Edited by Frerich J. Keil

 WILEY-VCH

Modeling of Process Intensification

Contents

Preface *XI*

List of Contributors *XIII*

1 Modeling of Process Intensification – An Introduction and Overview *1*

Frerich J. Keil

2 Process Intensification – An Industrial Point of View *9*

Robert Franke

2.1 Introduction *9*

2.1.1 Remarks on the Term Process Intensification *9*

2.1.2 Management Aspects *10*

2.2 Microreaction Technology *11*

2.2.1 Principal Features *11*

2.2.2 Catalytic Wall Reactors *12*

2.3 Simulation *15*

2.3.1 Introduction *15*

2.3.2 Molecular Simulations *16*

2.3.2.1 Quantum-chemical Calculations *16*

2.3.2.2 COSMO-RS Calculations *18*

2.3.2.3 Molecular-dynamics Calculations *19*

2.3.3 Monte Carlo Simulations in Project Valuation under Risk *20*

3 Modeling and Simulation of Microreactors *25*

Steffen Hardt

3.1 Introduction *25*

3.2 Flow Distributions *30*

3.2.1 Straight Microchannels *30*

3.2.2 Periodic and Curved Channel Geometries *32*

3.2.3 Multichannel Flow Domains *34*

3.3 Heat Transfer *39*

3.3.1	Straight Microchannels	39
3.3.2	Periodic and Curved Channel Geometries	41
3.3.3	Multichannel Flow Domains	43
3.3.4	Micro Heat Exchangers	47
3.4	Mass Transfer and Mixing	50
3.4.1	Simple Mixing Channels	51
3.4.2	Chaotic Micromixers	53
3.4.3	Multilamination Micromixers	59
3.4.4	Hydrodynamic Dispersion	62
3.5	Chemical Kinetics	66
3.5.1	Numerical Methods for Reacting Flows	66
3.5.2	Reacting Channel Flows	68
3.5.3	Heat-exchanger Reactors	71
3.6	Conclusions and Outlook	74
4	Modeling and Simulation of Unsteady-state-operated Trickle-flow Reactors	79
	<i>Rüdiger Lange</i>	
4.1	Introduction	79
4.2	Modeling	82
4.3	Reactor Model	85
4.4	Simulation	88
4.5	Conclusion	93
5	Packed-bed Membrane Reactors	99
	<i>Ákos Tóta, Dzmitry Hlushkou, Evangelos Tsotsas, and Andreas Seidel-Morgenstern</i>	
5.1	Introduction	99
5.1.1	The PBMR Principle	101
5.1.2	Case Study	101
5.1.3	Porous Membranes	102
5.1.4	Outline	103
5.2	One-dimensional Modeling of Packed-bed Membrane Reactors	103
5.2.1	One-dimensional Pseudohomogeneous Model	103
5.2.2	Cofeed (FBR) vs. Distributed Dosing of Reactants (PBMR) – Nonreactive Conditions	105
5.2.3	Comparison between FBR and PBMR – Reactive Conditions	107
5.2.4	Nonisothermal Operation	111
5.3	Two-dimensional Modeling of Packed-bed Membrane Reactors	114
5.3.1	Two-dimensional Model of PBMR – The Momentum-balance Equation	115
5.3.2	Two-dimensional Model of PBMR – The Mass-balance Equation	117
5.3.3	Two-dimensional Model of PBMR – The Energy-balance Equation	118
5.3.4	Boundary Conditions	119
5.3.5	Numerical Solution of the Two-dimensional Model	121

5.3.6	Velocity Field in a Packed-bed Membrane Reactor	122
5.3.7	The Influence of Membrane Permeability on the Boundary Conditions	123
5.3.8	Effect of Porosity Profile	126
5.3.9	Effect of Radial Mass-transport Limitations	127
5.3.10	Comparison of the $l(r)$ - and a_w -model Concepts – Temperature Profiles in a PBMR	129
5.4	Three-dimensional Modeling of a Packed-bed Membrane Reactor	132
5.4.1	Introduction to the Large-scale Simulation Methods in Fluid Mechanics and Mass Transport	132
5.4.2	Pressure and Velocity Field (Varying the Flow Distribution) – Comparison between FBR and PBMR	133
5.4.3	Advective-diffusive Mass Transport in PBMR	137
5.5	Summary and Conclusion	140
6	The Focused Action of Surface Tension versus the Brute Force of Turbulence – Scaleable Microchannel-based Process Intensification using Monoliths	149
	<i>Michiel T. Kreutzer, Annelies van Diepen, Freek Kapteijn, and Jacob A. Moulijn</i>	
6.1	Introduction	149
6.2	Monoliths – A Scalable Microchannel Technology	150
6.3	Power Required for Gas–Liquid Dispersion	152
6.3.1	Turbulent Contactors	152
6.3.2	Laminar Contactors	154
6.4	Physical Adsorption of Oxygen	156
6.5	Three-phase Processes	158
6.6	Discussion	160
6.6.1	Design Considerations for Intensified Monolith Processes	160
6.7	Conclusions	161
7	Chemical Reaction Modeling in Supercritical Fluids in Special Consideration of Reactions in Supercritical Water	165
	<i>Andrea Kruse and Eckhard Dinjus</i>	
7.1	Introduction	165
7.2	Properties of Supercritical Fluids	167
7.3	The C—C-bond Splitting of Tert.-butylbenzene	169
7.3.1	Experimental	170
7.3.2	Modeling	170
7.4	Total Oxidation in Supercritical Fluids	173
7.4.1	Is Oxidation in CO ₂ the same as Oxidation in Water?	175
7.4.2	Experimental	176
7.4.3	Modeling	177
7.5	Glycerol Degradation	179
7.5.1	Modeling	180
7.6	Conclusion	186

8	Ultrasound Reactors	193
8.1	Some Fundamentals of Ultrasonics and the Design of High Energy Density Cravice Reactors	193
	<i>Christian Horst</i>	
8.1.1	Introduction	193
8.1.2	Bubble Behavior in Acoustic Fields	196
8.1.2.1	Equations for the Motion of the Bubble Wall	196
8.1.2.2	Cavitation Thresholds	200
8.1.2.3	Influence of Parameters on Cavitation Behavior	202
8.1.2.4	Cavitation near Solid Boundaries	204
8.1.2.5	Finite Amplitude Waves and Shock Waves	205
8.1.2.6	Streaming	206
8.1.2.7	Bjerknes Forces	206
8.1.2.8	Forces on Small Particles	207
8.1.2.9	Sonochemical Effects	207
8.1.3	Modeling of Sound Fields	209
8.1.4	Examples of Sound Fields in Ultrasound Reactors	214
8.1.4.1	High-amplitude–High Energy Density Conical Reactor	214
8.1.4.2	Low-amplitude–High Energy Density Crevice Reactor	217
8.1.5	Modeling of Sonochemical Effects in Ultrasound Reactors	218
8.1.6	Summary	225
8.2	Design of Cavitational Reactors	226
	<i>Parag R. Gogate and Aniruddha B. Pandit</i>	
8.2.1	Introduction	226
8.2.2	Theoretical Approach	228
8.2.2.1	Identification of Stable or Transient Cavitation	231
8.2.2.2	Effect of Compressibility of Medium	233
8.2.2.3	Optimization of Operating Parameters	235
8.2.2.4	Development of Design Equations	235
8.2.3	Distribution of the Cavitational Activity in the Reactors	240
8.2.4	Intensification of Cavitational Activity in the Sonochemical Reactors	247
8.2.4.1	Use of Process-intensifying Parameters	249
8.2.4.2	Use of Combination of Cavitation and Advanced Oxidation Processes	250
8.2.5	Design of a Pilot-scale Reactor and its Experimental Evaluation	252
8.2.5.1	Rational for the Design of a Reactor	252
8.2.5.2	Actual Design of the Novel Reactor	253
8.2.5.3	Comparison of the Efficacy of the Hexagonal Flow-cell Reactor with Conventional Designs	254
8.2.6	Hydrodynamic Cavitation Reactors	257
8.2.6.1	Engineering Design of Hydrodynamic Cavitation Reactors	258
8.2.7	Comparison of Cavitational Yields in Acoustic and Hydrodynamic Cavitation	268
8.2.8	Qualitative Considerations for Reactor Choice, Scaleup and Optimization	268

8.2.9	Efforts Needed in the Future	271
8.2.10	Concluding Remarks	272
9	Modeling of Simulated Moving-bed Chromatography	279
	<i>Monika Johannsen</i>	
9.1	Introduction	279
9.2	From Elution Chromatography to Countercurrent Chromatography	280
9.2.1	The TMB Process	281
9.2.2	The SMB Process	282
9.3	Applications of SMB Chromatography	284
9.4	Modeling of Chromatographic Processes	287
9.4.1	Modeling of Single-column Chromatography	288
9.4.1.1	Ideal Model	290
9.4.1.2	Dispersive Model	291
9.4.1.3	Equilibrium Dispersive Model	292
9.4.1.4	Linear Driving Force (LDF) Model	293
9.4.1.5	General Rate Model	294
9.4.1.6	Initial and Boundary Conditions for Single-column Chromatography	295
9.4.2	Modeling of SMB Chromatography	296
9.4.2.1	Model Classification	296
9.4.2.2	Modeling of the TMB Process	297
9.4.2.3	Modeling of the SMB Process	299
9.4.2.4	Solution of the TMB Model with the Triangle Theory	299
9.4.2.5	Consideration of Different Adsorption Coefficients in the Zones	303
9.4.2.6	Modeling of Pressure Gradient in SFC	306
9.4.3	Numerical Algorithms	307
9.5	Simulations of SMB-SFC Chromatography	308
9.5.1	Separation of Cis/trans-Isomers of Phytol	308
9.5.2	Separation of Enantiomers of (R,S)-Ibuprofen	311
9.5.3	Separation of Tocopherols	314
9.6	Conclusion	317
10	Modeling of Reactive Distillation	323
	<i>Eugeniy Y. Kenig and Andrzej Górak</i>	
10.1	Introduction	323
10.2	Characteristics of Reactive Distillation	324
10.2.1	Column Internals for Reactive Distillation	324
10.3	Modeling Principles of Reactive Distillation	326
10.3.1	General Aspects	326
10.3.2	Equilibrium-stage Model	328
10.3.3	Rate-based Approach	329
10.3.3.1	Balance Equations	330
10.3.3.2	Mass Transfer and Reaction Coupling in the Fluid Film	332
10.3.3.3	Nonideal Flow Behavior in Catalytic Column Internals	333

10.3.3.4	Dynamic Modeling	336
10.4	Case Studies	336
10.4.1	Methyl Acetate Synthesis	336
10.4.1.1	Process Description	336
10.4.1.2	Process Modeling	338
10.4.1.3	Results and Discussion	339
10.4.2	Methyl Tertiary Butyl Ether	341
10.4.2.1	Process Description	341
10.4.2.2	Process Modeling	341
10.4.2.3	Results and Discussion	342
10.4.3	Ethyl Acetate Synthesis	343
10.4.3.1	Process Description	343
10.4.3.2	Process Modeling	347
10.4.3.3	Results and Discussion	347
10.4.4	Dymethyl Carbonate Transesterification	350
10.4.4.1	Process Description	350
10.4.4.2	Process Modeling	351
10.4.4.3	Results and Discussion	352
10.5	Conclusions and Outlook	355
11	Experimental and Theoretical Explorations of Weak- and Strong-gradient Magnetic Fields in Chemical Multiphase Processes	365
	<i>Faiçal Larachi</i>	
11.1	Background	365
11.1.1	Nonmagnetic Fluids	366
11.1.2	Magnetic Fluids	367
11.2	Nonmagnetic Fluids	368
11.2.1	Principle	368
11.2.2	Theory	370
11.2.3	Experimental Results and Discussion	371
11.3	Magnetic Fluids	378
11.3.1	Principle	378
11.3.2	Theory	380
11.3.2.1	Local Description	380
11.3.2.2	Upscaling	381
11.3.2.3	Closure Problem	384
11.3.2.4	Zero-order Axisymmetric Volume-average Model	386
11.3.3	Results and Discussion	386
11.4	Concluding Remarks	394
