

PRINCIPLES OF
BIOSEPARATIONS
ENGINEERING

RAJA GHOSH

Contents

Preface	ix
1. Overview of bioseparations engineering	1
1.1. Introduction	1
1.2. What is separated in bioseparation?	2
1.3. Economic importance of bioseparation	3
1.4. Nature of bioseparation	4
1.5. Basis of separation in bioseparation processes	5
1.6. Physical forms separated in bioseparation	6
1.7. Bioseparation techniques	8
1.8. The RIPP scheme	9
1.9. Example of bioseparation	10
1.10. Current trends in the bioseparation	10
2. Properties of biological material	13
2.1. Introduction	13
2.2. Size	13
2.3. Molecular weight	17
2.4. Diffusivity	19
2.5. Sedimentation coefficient	20
2.6. Osmotic pressure	21
2.7. Electrostatic charge	22
2.8. Solubility	23
2.9. Partition coefficient	24
2.10. Light absorption	24
2.11. Fluorescence	25

3. Mass transfer	29
3.1. Introduction	29
3.2. Molecular diffusion in liquid medium	30
3.3. Measurement of diffusivity	32
3.4. Estimation of diffusivity	33
3.5. Diffusion of solutes in dense solid	35
3.6. Diffusion of solutes in porous solid	35
3.7. Convective mass transfer	37
3.8. Experimental determination of mass transfer coefficient	40
3.9. Estimation of mass transfer coefficient	41
3.10. Inter-phase mass transfer	42
3.11. Unsteady state mass transfer	42
3.12. Equilibrium and rate processes	45
4. Cell disruption	49
4.1. Introduction	49
4.2. Cells	49
4.3. Cell disruption using bead mill	53
4.4. Cell disruption using rotor-stator mill	56
4.5. Cell disruption using French press	56
4.6. Cell disruption using ultrasonic vibrations	58
4.7. Cell disruption using detergents	61
4.8. Cell disruption using enzymes	61
4.9. Cell disruption using organic solvents	62
4.10. Cell disruption by osmotic shock	62
5. Precipitation	65
5.1. Introduction	65
5.2. Factors utilized for precipitation	66
5.3. Precipitation using organic solvents	69
5.4. Precipitation using anti-chaotropic salts	72
5.5. Mechanism of precipitate formation	74
6. Centrifugation	79
6.1. Introduction	79
6.2. Laboratory centrifuge	80
6.3. Preparative centrifuge	83

6.4. Ultracentrifugation	87
7. Extraction	89
7.1. Introduction	89
7.2. Solvent systems	89
7.3. Theory of extraction	90
7.4. Aqueous two-phase extraction	93
7.5. Batch extraction	95
7.6. Single-stage continuous extraction using immiscible solvents	95
7.7. Batch extraction using partially miscible solvents	102
7.8. Cross-current continuous extraction using immiscible solvents	103
7.9. Staged counter-current extraction	104
7.10. Differential extraction	109
7.11. Supercritical fluid extraction	113
8. Adsorption	121
8.1. Introduction	121
8.2. Adsorbents	122
8.3. Separation mechanisms	123
8.4. Adsorption isotherms	132
8.5. Diffusional limitations in adsorption processes	135
8.6. Batch adsorption	136
8.7. Packed bed adsorption	140
8.8. Other types of adsorption devices	147
9. Chromatography	151
9.1. Introduction	151
9.2. Chromatography system	152
9.3. Theory of chromatography	158
9.4. Shape and yield of a chromatographic peak	167
9.5. Binary chromatography	173
9.6. Hydrodynamic chromatography	176
10. Filtration	181
10.1. Introduction	181
10.2. Theory of filtration	181

10.3. Filter medium	183
10.4. Driving force	183
10.5. Constant pressure cake filtration	184
10.6. Constant rate cake filtration	190
10.7. Improvement of filtration efficiency	191
10.8. Mode of operation	192
10.9. Filtration equipment	194
11. Membrane based bioseparation	199
11.1. Introduction	199
11.2. Classification of membrane processes	205
11.3. Membrane equipment	206
11.4. Ultrafiltration	211
11.5. Microfiltration	232
11.6. Dialysis	235
11.7. Liquid membrane processes	240
11.8. Membrane chromatography	242
12. Miscellaneous bioseparation processes	251
12.1. Introduction	251
12.2. Electrophoresis	251
12.3. Affinity ultrafiltration	255
12.4. Field-flow fractionation	255
Index	257
