Publishing

# Contents

<b>1 Introduction</b>	<b>1</b>	Testing plant resistance	31
Requirements of plant breeders	1	Conclusions	32
Evolution of crop species	3	<i>Think questions</i>	32
Why did hunter gathers become farmers?	3		
What crops were involved? And when did this occur?	4		
Natural and human selection	6		
Contribution of modern plant breeders	7		
<i>Think questions</i>	9		
<b>2 Modes of reproduction and types of cultivar</b>	<b>11</b>	<b>4 Breeding schemes</b>	<b>34</b>
Introduction	11	Introduction	34
Modes of reproduction	12	Development of self-pollinating cultivars	34
Sexual reproduction	13	Homozygosity	35
Asexual reproduction	14	Single seed descent	36
Reproduction through plant parts	14	Off-season sites	36
Reproduction by apomixis	14	Breeding schemes for pure-line cultivars	37
Types of cultivar	14	Bulk method	37
Pure-line cultivars	15	Pedigree method	38
Open-pollinated cultivars	15	Bulk/pedigree method	38
Hybrid cultivars	15	Modified pedigree method	39
Clonal cultivars	15	Number of segregating populations and selections	40
Synthetic cultivars	16	Seed increases for cultivar release	40
Multiline cultivars	16	Mass bulk increase	40
Composite-cross cultivars	16	Progeny test increase	40
Annuals and perennials	16	Developing multiline cultivars	41
Reproductive sterility	16	Backcrossing	42
<i>Think questions</i>	16	Development of outbreeding cultivars	43
<b>3 Breeding objectives</b>	<b>18</b>	Breeding schemes for open-pollinating population cultivars	43
Introduction	18	Mass selection	43
People, political and economic criteria	18	Recurrent phenotypic selection	43
Increasing grower profitability	21	Progeny testing	44
Increasing harvestable yield	22	Backcrossing on open pollinated-cultivar development	44
Selection for yield increase	22	Seed production	44
Increasing end-use quality	23	Developing synthetic cultivars	44
Testing for end-use quality	25	Seed production of a synthetic cultivar	46
Increasing pest and disease resistance	26	Developing hybrid cultivars	46
Types of plant resistance	29	Heterosis	48
Mechanisms for disease resistance	30	Types of hybrid	51
		Breeding system for hybrid cultivars	51
		Backcrossing in hybrid cultivar development	52
		Hybrid seed production and cultivar release	52

Development of clonal cultivars	53	Heritability from offspring–parent regression	100
Outline of a potato breeding scheme	54	Diallel crossing designs	102
Time to develop clonal cultivars	55	Griffing's Analysis	103
Sexual reproduction in clonal crops	56	Example of Griffing analysis of half diallel	106
Maintaining disease-free parental lines and breeding selections	56	Hayman and Jinks' analysis	107
Seed increase of clonal cultivars	57	Estimating $b_n^2$ from Hayman and Jink's Analysis	110
Developing apomictic cultivars	57	Cross prediction	111
Summary	58	<i>Think questions</i>	112
<i>Think questions</i>	58		
<b>5 Genetics and plant breeding</b>	<b>60</b>	<b>7 Selection</b>	<b>116</b>
Introduction	60	Introduction	116
Qualitative genetics	60	What to select and when to select	116
Genotype/phenotype relationships	61	Qualitative trait selection	117
Segregation of qualitative genes in diploid species	62	Quantitative trait selection	117
Qualitative linkage	64	Positive and negative selection	117
Pleiotropy	67	Response to selection	117
Epistasis	67	Association between variates or years	120
Qualitative inheritance in tetraploid species	68	Heritability and its limitations	121
The chi-square test	70	Methods of selection	121
Improper use of chi-square	71	Independent cull selection	122
Family size necessary in qualitative genetic studies	72	Index selection	122
Quantitative genetics	73	Errors in selection	123
The basis of continuous variation	73	Applied selection	126
Describing continuous variation	74	Number of genotypes in initial populations	127
The normal distribution	74	Early generation selection	128
Variation between data sets	76	Visual assessment	129
Relating quantitative genetics and the normal distribution	77	Mass selection	130
Quantitative genetics models	78	Efficiency of early generation selection	130
Testing the models	81	Intermediate generation selection	131
The A-scaling test	82	Field trials	131
Joint scaling test	84	Variates recorded	132
What could be wrong with the model	87	Data analysis and interpretation	132
Quantitative trial loci	88	Selection	133
<i>Think questions</i>	92	Advanced selection	133
		Choice of advanced trial locations	133
<b>6 Predictions</b>	<b>96</b>	Number of locations	134
Introduction	96	Experimental design	135
Genotype $\times$ environment interactions	96	Genotype by environment interactions	135
Genetically based predictions	97	Analysis of location trials	136
Heritability	97	Bartlett test	136
Broad-sense heritability	98		
Narrow-sense heritability	99		

Detecting significant treatment $\times$ environment interactions	137	Tissue culture	166
Worked example	138	Haploidy	166
Interpreting $G \times E$ interactions	139	Techniques used for producing haploids <i>in vitro</i>	166
Selection	141	Some potential problems	167
Cross prediction	141	Genotype dependence	167
Univariate cross prediction	141	Somaclonal variation	167
Estimation of $m$ and $V_A$	142	Non-random recovery of haploid lines	167
Setting target values	143	Practical applications of haploids	167
Predicted from number in sample	144	<i>In vitro</i> multiplication	168
Use of cross prediction in clonal crops	144	Plant transformation	168
Use of normal distribution function tables	145	Some applications of genetic engineering to plant breeding	169
Univariate cross prediction example	145	Process of plant transformation	170
Multi-variate cross prediction	147	Cautions and related issues	171
Example of multi-variate cross prediction	148	Molecular markers in plant breeding	172
Observed number in a sample from each cross	148	Theory of using markers	172
Use of rankings	148	Types of marker systems	173
Parental selection	149	Molecular markers	174
Phenotypic evaluation	149	Non-PCR methods – DNA/DNA hybridization	174
Genotypic evaluation	150	PCR methods – arbitrarily primed techniques – multi-locus systems	175
Parental combinations	151	PCR methods – site targeted techniques – single locus systems	175
Germplasm collections	151	Uses of molecular markers	175
<i>Think questions</i>	152	Problems with markers	176
<b>8 Alternative techniques in plant breeding</b>	157	<i>Think questions</i>	177
Introduction	157	<b>9 Some practical considerations</b>	178
Induced mutation	157	Introduction	178
Method of increasing the frequency of mutation	158	Experimental design	178
Types of mutation	158	Unreplicated designs	179
Plant parts to be treated	158	Randomized designs	180
Dose rates	159	Completely randomized designs	180
Dangers of using mutagens	159	Randomized complete block designs	181
Impact of mutation breeding	160	Factorial designs	181
Practical applications	160	Split-plot designs	182
Interspecific and intergeneric hybridization	162	Greenhouse management	182
Characters introduced to crops from wild related species	163	Artificial hybridization	182
Factors involved in interspecific or intergeneric hybridization	163	Seed and generation increases	184
Hybrid sterility	165	Evaluation of breeding lines	184
Backcrossing	165	Environmental control	185
Increasing genetic diversity	165	Disease control	185
Creating new species	165	Economics	186
		Experimental design in the glasshouse	187
		Field plot techniques	187
		Choice of land	187

---

Plot size and replication	188	Release of new cultivars	197
Guard rows and discard rows	190	Information needed prior to cultivar release	198
Machinery	190	Distinctness, uniformity and stability (DUS)	198
Use of computers in plant breeding	192	Value in release	198
Data storage and retrieval	193	Cultivar names	198
Field plan design	194	Cultivar protection	199
Clerical operations	194	Patents	199
Data collection	195	Genetically modified crop plants	200
Data analysis	195	<i>Think questions</i>	201
Selection	196	<b>Index</b>	<b>203</b>
Data transfer	197		
Statistician consultation	197		
Ease of use	197
