# Contents

<b>Preface</b>	xiii
<b>Acknowledgements</b>	xv
<b>Chapter 1 Basic Concepts</b>	1
1.1 Statics, dynamics and structural dynamics	1
1.2 Coordinates, displacement, velocity and acceleration	1
1.3 Simple harmonic motion	2
1.3.1 Time history representation	3
1.3.2 Complex exponential representation	5
1.4 Mass, stiffness and damping	7
1.4.1 Mass and inertia	7
1.4.2 Stiffness	10
1.4.3 Stiffness and flexibility matrices	12
1.4.4 Damping	14
1.5 Energy methods in structural dynamics	16
1.5.1 Rayleigh's energy method	17
1.5.2 The principle of virtual work	19
1.5.3 Lagrange's equations	21
1.6 Linear and non-linear systems	23
1.7 Systems of units	23
1.7.1 Absolute and gravitational systems	24
1.7.2 Conversion between systems	26
1.7.3 The SI system	27
References	28
<b>Chapter 2 The Linear Single Degree of Freedom System: Classical Methods</b>	29
2.1 Setting up the differential equation of motion	29
2.1.1 Single degree of freedom system with force input	29
2.1.2 Single degree of freedom system with base motion input	33
2.2 Free response of single-DOF systems by direct solution of the equation of motion	34
2.3 Forced response of the system by direct solution of the equation of motion	38

<b>Chapter 3</b>	<b>The Linear Single Degree of Freedom System: Response in the Time Domain</b>	45
3.1	Exact analytical methods	46
3.1.1	The Laplace transform method	46
3.1.2	The convolution or Duhamel integral	50
3.1.3	Listings of standard responses	53
3.2	'Semi-analytical' methods	55
3.2.1	Impulse response method	56
3.2.2	Straight-line approximation to input function	56
3.2.3	Superposition of standard responses	56
3.3	Step-by-step numerical methods using approximate derivatives	59
3.3.1	Euler method	60
3.3.2	Modified Euler method	62
3.3.3	Central difference method	62
3.3.4	The Runge–Kutta method	65
3.3.5	Discussion of the simpler finite difference methods	69
3.4	Dynamic factors	70
3.4.1	Dynamic factor for a square step input	70
3.5	Response spectra	72
3.5.1	Response spectrum for a rectangular pulse	72
3.5.2	Response spectrum for a sloping step	74
	References	76
<b>Chapter 4</b>	<b>The Linear Single Degree of Freedom System: Response in the Frequency Domain</b>	77
4.1	Response of a single degree of freedom system with applied force	77
4.1.1	Response expressed as amplitude and phase	77
4.1.2	Complex response functions	81
4.1.3	Frequency response functions	83
4.2	Single-DOF system excited by base motion	86
4.2.1	Base excitation, relative response	87
4.2.2	Base excitation: absolute response	91
4.3	Force transmissibility	93
4.4	Excitation by a rotating unbalance	94
4.4.1	Displacement response	95
4.4.2	Force transmitted to supports	96
	References	97
<b>Chapter 5</b>	<b>Damping</b>	99
5.1	Viscous and hysteretic damping models	99
5.2	Damping as an energy loss	103
5.2.1	Energy loss per cycle – viscous model	103
5.2.2	Energy loss per cycle – hysteretic model	104
5.2.3	Graphical representation of energy loss	105
5.2.4	Specific damping capacity	106
5.3	Tests on damping materials	108

5.4	Quantifying linear damping	108
5.4.1	Quality factor, $Q$	108
5.4.2	Logarithmic decrement	109
5.4.3	Number of cycles to half amplitude	110
5.4.4	Summary table for linear damping	111
5.5	Heat dissipated by damping	112
5.6	Non-linear damping	112
5.6.1	Coulomb damping	113
5.6.2	Square law damping	113
5.7	Equivalent linear dampers	114
5.7.1	Viscous equivalent for coulomb damping	115
5.7.2	Viscous equivalent for square law damping	116
5.7.3	Limit cycle oscillations with square-law damping	117
5.8	Variation of damping and natural frequency in structures with amplitude and time	117
<b>Chapter 6 Introduction to Multi-degree-of-freedom Systems</b>		<b>119</b>
6.1	Setting up the equations of motion for simple, undamped, multi-DOF systems	119
6.1.1	Equations of motion from Newton's second law and d'Alembert's principle	120
6.1.2	Equations of motion from the stiffness matrix	120
6.1.3	Equations of motion from Lagrange's equations	121
6.2	Matrix methods for multi-DOF systems	122
6.2.1	Mass and stiffness matrices: global coordinates	122
6.2.2	Modal coordinates	126
6.2.3	Transformation from global to modal coordinates	127
6.3	Undamped normal modes	132
6.3.1	Introducing eigenvalues and eigenvectors	132
6.4	Damping in multi-DOF systems	142
6.4.1	The damping matrix	142
6.4.2	Damped and undamped modes	143
6.4.3	Damping inserted from measurements	144
6.4.4	Proportional damping	145
6.5	Response of multi-DOF systems by normal mode summation	147
6.6	Response of multi-DOF systems by direct integration	155
6.6.1	Fourth-order Runge–Kutta method for multi-DOF systems	156
<b>Chapter 7 Eigenvalues and Eigenvectors</b>		<b>159</b>
7.1	The eigenvalue problem in standard form	159
7.1.1	The modal matrix	161
7.2	Some basic methods for calculating real eigenvalues and eigenvectors	162
7.2.1	Eigenvalues from the roots of the characteristic equation and eigenvectors by Gaussian elimination	162
7.2.2	Matrix iteration	165
7.2.3	Jacobi diagonalization	168

7.3	Choleski factorization	177
7.4	More advanced methods for extracting real eigenvalues and eigenvectors	178
7.5	Complex (damped) eigenvalues and eigenvectors	179
	References	180
<b>Chapter 8 Vibration of Structures</b>		<b>181</b>
8.1	A historical view of structural dynamics methods	181
8.2	Continuous systems	182
	8.2.1 Vibration of uniform beams in bending	182
	8.2.2 The Rayleigh–Ritz method: classical and modern	189
8.3	Component mode methods	194
	8.3.1 Component mode synthesis	195
	8.3.2 The branch mode method	208
8.4	The finite element method	213
	8.4.1 An overview	213
	8.4.2 Equations of motion for individual elements	221
8.5	Symmetrical structures	234
	References	235
<b>Chapter 9 Fourier Transformation and Related Topics</b>		<b>237</b>
9.1	The Fourier series and its developments	237
	9.1.1 Fourier series	237
	9.1.2 Fourier coefficients in magnitude and phase form	243
	9.1.3 The Fourier series in complex notation	245
	9.1.4 The Fourier integral and Fourier transforms	246
9.2	The discrete Fourier transform	247
	9.2.1 Derivation of the discrete Fourier transform	248
	9.2.2 Proprietary DFT codes	255
	9.2.3 The fast Fourier transform	256
9.3	Aliasing	256
9.4	Response of systems to periodic vibration	260
	9.4.1 Response of a single-DOF system to a periodic input force	261
	References	265
<b>Chapter 10 Random Vibration</b>		<b>267</b>
10.1	Stationarity, ergodicity, expected and average values	267
10.2	Amplitude probability distribution and density functions	270
	10.2.1 The Gaussian or normal distribution	274
10.3	The power spectrum	279
	10.3.1 Power spectrum of a periodic waveform	279
	10.3.2 The power spectrum of a random waveform	281
10.4	Response of a system to a single random input	286
	10.4.1 The frequency response function	286
	10.4.2 Response power spectrum in terms of the input power spectrum	287

10.4.3	Response of a single-DOF system to a broadband random input	288
10.4.4	Response of a multi-DOF system to a single broad-band random input	296
10.5	Correlation functions and cross-power spectral density functions	299
10.5.1	Statistical correlation	299
10.5.2	The autocorrelation function	300
10.5.3	The cross-correlation function	302
10.5.4	Relationships between correlation functions and power spectral density functions	303
10.6	The response of structures to random inputs	305
10.6.1	The response of a structure to multiple random inputs	305
10.6.2	Measuring the dynamic properties of a structure	307
10.7	Computing power spectra and correlation functions using the discrete Fourier transform	310
10.7.1	Computing spectral density functions	312
10.7.2	Computing correlation functions	314
10.7.3	Leakage and data windows	317
10.7.4	Accuracy of spectral estimates from random data	318
10.8	Fatigue due to random vibration	320
10.8.1	The Rayleigh distribution	321
10.8.2	The S–N diagram	322
	References	324
<b>Chapter 11 Vibration Reduction</b>		<b>325</b>
11.1	Vibration isolation	326
11.1.1	Isolation from high environmental vibration	326
11.1.2	Reducing the transmission of vibration forces	332
11.2	The dynamic absorber	332
11.2.1	The centrifugal pendulum dynamic absorber	336
11.3	The damped vibration absorber	338
11.3.1	The springless vibration absorber	342
	References	345
<b>Chapter 12 Introduction to Self-Excited Systems</b>		<b>347</b>
12.1	Friction-induced vibration	347
12.1.1	Small-amplitude behavior	347
12.1.2	Large-amplitude behavior	349
12.1.3	Friction-induced vibration in aircraft landing gear	350
12.2	Flutter	353
12.2.1	The bending-torsion flutter of a wing	354
12.2.2	Flutter equations	358
12.2.3	An aircraft flutter clearance program in practice	360
12.3	Landing gear shimmy	362
	References	366

<b>Chapter 13</b>	<b>Vibration testing</b>	367
13.1	Modal testing	368
13.1.1	Theoretical basis	368
13.1.2	Modal testing applied to an aircraft	369
13.2	Environmental vibration testing	373
13.2.1	Vibration inputs	373
13.2.2	Functional tests and endurance tests	374
13.2.3	Test control strategies	375
13.3	Vibration fatigue testing in real time	376
13.4	Vibration testing equipment	377
13.4.1	Accelerometers	377
13.4.2	Force transducers	378
13.4.3	Exciters	378
	References	385
<b>Appendix A</b>	<b>A Short Table of Laplace Transforms</b>	387
<b>Appendix B</b>	<b>Calculation of Flexibility Influence Coefficients</b>	389
<b>Appendix C</b>	<b>Acoustic Spectra</b>	393
