Contents

Introduction	1	Spermatogenesis	25
Why Study Human Embryology?	2	Spermatozoa abnormalities	25
Link between development and cancer	3	Oogenesis	28
Periods of Human Embryology	4	Chromosomal abnormalities result	
Note about gene names	4	in spontaneous abortion or	
Why do we age?	5	abnormal development	32
Progeria: premature aging	6	Many chromosomal anomalies arise	
Phases of Human Embryology	6	during gametogenesis and	
Period of Egg and Embryo:		cleavage	32
Summary of Main Events	8	Chromosome analysis can determine	
Body Axes: Understanding Embryonic		parental source of defective	
Coordinates	9	chromosome and provides basis	
Want to Learn More?	12	for diagnosis and possible	
1 Gametogenesis, Fertilization, and		treatment	34
First Week	15	Ovulation	35
Primordial Germ Cells	17	Menstrual Cycle	37
Teratoma formation	18	Fertilization	39
Origin of PGCs	19	Cleavage	41
Molecular regulation of PGC		What determines whether a	
development	19	blastomere will form inner cell	
Gametogenesis	20	mass or trophoblast?	43
Why is timing of gametogenesis different		End of First Week: Initiating Implantation	43
in males and females?	20	Contraception	44
		Assisted reproductive technology	46

In the research lab
In the clinic

2	Second Week: Becoming Bilaminar and Fully Implanting	51			
	Becoming Fully Implanted	53			
	What regulates the initial phase of implantation: blastocyst adherence to the uterine epithelium?	53			
	Why isn't conceptus rejected by its mother?	55			
	Initiating endoderm formation	56			
	Development of Amniotic Cavity	57			
	Development of Yolk Sac and Chorionic Cavity	57			
	Uteroplacental Circulatory System Begins to Develop during Second Week	58			
	Hydatidiform moles	60			
	Genomic imprinting	64			
	X inactivation	67			
	X inactivation affects inheritance of congenital disease	67			
	Genomic imprinting affects inheritance of congenital disease	67			
3	Third Week: Becoming Trilaminar and Establishing Body Axes	69			
	Overview of Gastrulation: Forming Three Primary Germ Layers and Body Axes	71			
	Induction of primitive streak	71			
	Cellular basis of primitive streak formation	72			
	Establishing left-right axis	73			
	Development in animal models versus humans	76			
	Cellular basis of gastrulation	80			
	Establishing medial-lateral subdivisions of mesoderm	81			
	Specifics of Gastrulation: Moving Cells to New Locations and Making Organ Rudiments That Undergo Inductive Interactions	83			
	Cellular basis of convergent extension	87			
	Molecular mechanism of somitogenesis	88			
	Abnormal gastrulation leads to caudal dysplasia	92			
	Formation of Neural Plate	94			
	Neural induction	94			
	Head, trunk, and tail organizers	97			
	Primary versus Secondary Body Development	97			
4	Fourth Week: Forming the Embryo	101			
	Tube-within-a-Tube Body Plan Arises through Body Folding	103			
	Anterior body wall defects	106			
	Neurulation: Establishing the Neural Tube, the Rudiment of the Central Nervous System	107			
	Mechanisms of neurulation	110			
	Actin-binding proteins and apical constriction	112			
	Dorsal-ventral patterning of the neural tube	112			
	Neural tube defects (NTDs)	113			
	Secondary Neurulation	117			
	Cranial-Caudal Regionalization of the Neural Tube	117			
	Neural Crest Cells	119			
	Epithelial-to-mesenchymal transformation (EMT)	119			
	What local factors guide migration of neural crest cells?	121			
	Mutants provide information about mechanisms of neural crest cell migration and developmental restriction	122			
	Survival and differentiation of peripheral neurons	128			
	Neural crest cell disease: neurocristopathies	128			
	Somite Differentiation: Forming Dermatome, Myotome, and Sclerotome	128			
	Inductive interactions underlie formation of somite subdivisions	128			
	Spinal anomalies	130			
5	Principles and Mechanisms of Morphogenesis and Dymorphogenesis	133			
	Principles of Morphogenesis and Dymorphogenesis	133			
	Animal Models	135			
	Experimental Techniques	142			
	Signaling Pathways	150			
	Embryonic Stem Cells and Cloning	162			

Fetal Development and the Fetus as Patient 167

During Fetal Period, Embryonic Organ Systems Mature and Fetus Grows	169
Development of Placenta	170
Development of Umbilical Cord	171
Exchange of Substances between Maternal and Fetal Blood in Placenta	173
Intrauterine Growth Restriction	178
Maternal Diabetes and Obesity	178
Placenta Produces Several Important Hormones	179
Production and Resorption of Amniotic Fluid	179
Twinning	179
Prenatal Diagnosis Assesses Health of Unborn	180
Treating Fetus in Utero	186
Fetal Cord Blood and Stem Cells	189

7 Development of the Skin and Its Derivatives 193

Origin of Epidermis and Dermis of Skin	195
Molecular regulation of skin differentiation	197
Inherited skin diseases	198
Development of Skin Derivatives	202
Anomalies of skin derivatives	202
Regulation of hair patterning and differentiation	205
Hair anomalies	206
Wnt signaling and development of mammary gland	209
Tooth induction	214
Tooth anomalies	214

8 Development of the Musculoskeletal System 217

Tissue Origins and Differentiation of Musculoskeletal System	219
Commitment to musculoskeletal lineage	221
Somites Differentiate into Sclerotome, Myotome, and Dermatome	222
Resegmentation of Sclerotomes	217

Subdivision of sclerotome	222
Specification of vertebrae identity	227
Vertebral defects	230

Myotomes and Dermatomes Develop at Segmental Levels	231
Myogenic commitment in somite	234
Long Bone and Joint Development	234
Molecular regulation of bone and joint development	237
Defects in skeletal development	239
Development of Limb Muscles	241
Migration of muscle progenitors	242
Muscle cell and fiber type commitment	244
Regional differences in development of muscles	244
Muscular dystrophy	244

9 Development of the Central Nervous System 247

Structural Divisions of Nervous System	251
Functional Divisions of Nervous System	251
Primary Brain Vesicles Subdivide to Form Secondary Brain Vesicles	251
Positional information patterns: neural plate and tube	253
Formation of Brain Flexures	255
Cytodifferentiation of Neural Tube	255
Differentiation of Spinal Cord	257
Differentiation of Brain	258
Cellular and molecular basis of cerebellar malformations and dysfunction	267
Mouse mutants with cerebellar ataxias	269
Development of visual system: example of how nervous system wires itself	274
Congenital malformations of cerebral cortex	285
Kallmann syndrome	287
Growth of the Brain	290
Brain size	290

10 Development of the Peripheral Nervous System 297

Structural Divisions of Nervous System	299
--	-----

Functional Divisions of Nervous System	299
Origin of PNS	300
Specification and plasticity of precursor cells of PNS	300
Neural crest cells and their derivatives as stem cells	301
Neurofibromatosis type 1 (NF-1)	302
Neurogenesis in PNS	302
Development of Trunk PNS	303
Hereditary peripheral neuropathies	306
Regulating axonal guidance in PNS	311
Development of Cranial PNS	313
11 Development of the Respiratory System and Body Cavities	319
Development of Lungs and Respiratory Tree	321
Developmental abnormalities of lung and respiratory tree	324
Lung maturation and survival of premature infants	325
Approaches for studying lung development and branching morphogenesis	327
Drosophila tracheal system development	328
Partitioning of Coelom and Formation of Diaphragm	329
Diaphragmatic defects and pulmonary hypoplasia	334
Oligohydramnios and pulmonary hypoplasia	334
Congenital diaphragmatic hernia	335
12 Development of the Heart	337
Establishing Cardiac Lineage	339
Formation of Primitive Heart Tube	339
Specification of cardiac progenitor cells	340
Role of secondary heart field in formation of outflow segment of heart	349
Gene mutations target primary and secondary heart fields	349
Cardiac Looping	350
Formation of Primitive Blood Vessels Associated with Endocardial Tube	350

Mechanisms driving cardiac bending and looping	352
Sidedness in heart looping	353
Subregions of heart are specified early in development	354
Coordinated Remodeling of Heart Tube and Primitive Vasculature Produces Systemic and Pulmonary Circulations	355
Septation of Heart	360
Epithelial-to-mesenchymal transformation during endocardial cushion cell formation	361
Effects of hyperglycemia and hypoxia on cushion tissue formation	362
Myocardium develops two layers	369
Neural crest cell contribution to outflow tract septation	375
Many heart defects may be related to interactions between secondary heart field and neural crest cells	376
Development of Pacemaker and Conduction System	376
Development of Epicardium and Coronary Vasculature	377
Frequency and etiology of cardiovascular malformations	378
Common heart malformations	378
Known genetic causes of heart malformations	382
22q11.2 deletions and heart malformations	383
13 Development of the Vasculature	385
Formation of Vasculature Begins Early in Third Week	388
Second source of hematopoietic stem cells	390
Intraembryonic hematopoietic stem cells may be source of definitive hematopoietic stem cells	390
Vasculogenesis	392
Methods for visualizing blood vessel formation	392
What initiates and controls vasculogenesis?	393

Angiogenesis expands and remodels initial vascular complex	395	Regulation of number of islet cells	454
Formation of arteries versus veins	397	Development of Spleen	454
Angiomas	399	Derivatives of Ventral Mesentery	454
Hereditary hemorrhagic telangiectasia	401	Development of Midgut	456
Treatment of corticosteroid-resistant hemangiomas in humans	401	Abnormal rotation and fixation of midgut	456
Development of Aortic Arches	402	Defects of the umbilicus and anterior abdominal wall	458
Tissue interactions direct pharyngeal aortic arch remodeling	407	Cytodifferentiation of Endodermal Epithelium of Gut	462
Dorsal Aorta Develops Ventral, Lateral, and Posterolateral Branches	408	Differentiation of gastrointestinal tract epithelium	464
Vascular anomalies arising from errors in remodeling of great vessels	413	Faulty Wnt signaling and β -catenin turnover is often a prelude to colon cancer	465
Formation of "vascular rings" that constrict esophagus and trachea	413	Development of Outer Intestinal Wall and Its Innervation	467
Coarctation of the aorta	415	Hirschsprung disease	470
Primitive Embryonic Venous System is Divided into Vitelline, Umbilical, and Cardinal Systems	419	Irritable bowel syndrome	470
Vena cava anomalies	424	Infantile hypertrophic pyloric stenosis	470
Development of Lymphatic System	425	Hirschsprung disease and neural crest cell defects	471
Molecular mechanisms of lymphatic development	428	Development of Hindgut	472
Lymphedema may result from lymphatic hypoplasia	428	Hindgut abnormalities and associated abdominal wall defects	475
Dramatic Changes Occur in Circulatory System at Birth	429	Urachal anomalies	475
Patent ductus arteriosus leads to heart failure if not corrected	432	15 Development of the Urogenital System	479
Development of the Gastrointestinal Tract	435	Three Nephric Systems Develop	483
Body Folding	437	Formation of nephric lineage	486
Dorsal Mesentery Initially Suspends Abdominal Gut Tube	439	Factors expressed in metanephric mesoderm regulate induction of budding and branching of the ureteric bud	490
Three Regions of Primitive Gut	441	Signals from ureteric bud induce nephrogenic mesoderm to condense while mesoderm drives continual ureteric branching and growth	490
Regionalization of gut tube demarcates sites of organ formation	442	Influences between ureteric bud and metanephric blastema induce formation of nephron through mesenchymal-to-epithelial conversion of blastema	493
Development of Abdominal Foregut	445	Renal agenesis and dysplasia	493
Hepatoblast specification and fate	449	Mutations causing nephron pathologies	494
Abnormal formation and rotation of ventral pancreas	452		
<i>Notch</i> signaling and pancreatic cell lineage determination	452		

Congenital polycystic kidney disease	495	Descent of the testes	526
Ascent of Kidneys	495	Cryptorchidism	530
Contributions of Hindgut Endoderm to Urinary Tract	495	Ovaries Become Suspended in Broad Ligament of Uterus and Are Held High in Abdominal Cavity by Cranial Suspensory Ligaments	530
Urinary tract anomalies	497	Pseudohermaphroditism	531
Development of Suprarenal Gland	499	Defective partitioning of cloaca	536
Congenital adrenal hyperplasia	500		
Genital System Arises with Urinary System	500	16 Development of the Pharyngeal Apparatus and Face	543
Initiating Male versus Female Development	503	Origin of Skull	545
<i>Sox9</i> gene is likely a primary target of <i>Sry</i> expression	505	Holoprosencephaly	547
Sertoli cells are main organizer of testes	505	Craniosynostosis	550
Sex reversal	508	Development of Pharyngeal Arches	551
Hermaphrodites	508	Hindbrain is segmented	560
Müllerian duct regression and <i>Amh</i> -mediated upregulation of metalloproteinase expression	509	Retinoic acid acts in normal and abnormal development of head and neck	560
Mutations in <i>Amh</i> or its receptor causes persistent müllerian duct syndrome in XY individuals	509	Development of Face	563
Differentiation of Leydig cells	510	Outgrowth of facial prominences is regulated by epithelial-mesenchymal interactions	564
Development of the epididymus, vas deferens, and seminal vesicles	512	Patterning of facial prominences is regulated by epithelial-mesenchymal interactions	566
Cystic fibrosis transmembrane conductance regulator is required for vas deferens development	512	<i>Dlx</i> code patterns the first pharyngeal arch	566
Development of prostate gland	512	Development of Nasal and Oral Cavities	568
In Absence of Y Chromosome, Female Development Occurs	515	Facial clefting	569
Female gonadogenesis is not a simple matter of default	516	Development of Sinuses	571
Müllerian duct development and regionalized expression of <i>Hox</i> genes	518	Fate of Pharyngeal Clefts	572
Anomalies of uterus	520	Pharyngeal Arches Give Rise to Tongue	573
Diethylstilbestrol causes several reproductive anomalies	520	Development of Thyroid Gland	576
Development of External Genitalia	521	Development of Pharyngeal Pouches	576
Formation of external genitalia	522	Development of Salivary Glands	578
Suspension of Mesonephric-Gonadal Complex within Abdomen	525	Causes of craniofacial anomalies	579
Development of the Inguinal Canals	525	Craniofacial syndromes	580
Descent of Testes	526	17 Development of the Ears and Eyes	583
		Ear Development	588
		Induction and patterning of rudiments of inner ear	588

Formation of sensory cells	593
Malformations of inner ear:	
sensorineural hearing loss	597
Malformations of external and middle ear: conductive hearing loss	601
Eye Development	602
Formation of eye field	602
Formation and morphogenesis of lens	604
Patterning of eye	608
Differentiation of pigmented epithelium	610
Regulation of proliferation and differentiation of retinal progenitor cells	610
Abnormalities of eye	613
Development of the Limbs	617
Epithelial-Mesenchymal Interactions	
Control Limb Outgrowth	619

Patterning of limb bud	621
Growth and patterning along proximal-distal axis	621
Morphogenesis of Limb Bud	626
Specification of cranial-caudal axis	628
Specification of dorsal-ventral axis	630
Cessation of limb outgrowth and morphogenesis of autopod	630
Congenital anomalies of limbs	632
Tissue Origins of Limb Structures	639
Differentiation of Limb Bones	639
Innervation of Developing Limb Bud	640
Specification and projection of limb motor axons	642
Figure Credits	645
Index	653
