**Materials Selection
and Design**

The Materials
Information Society

Contents

Section 1: The Design Process 1

Chairperson: John R. Dixon, Professor Emeritus, University of Massachusetts

The Role of the Materials Engineer in Design	3
The Design Process	4
Criteria and Concepts in Design	4
Design Tools	5
The Materials Selection Process	5
Effects of Composition, Processing, and Structure on Materials Properties	6
Properties versus Performance of Materials	6
Manufacturing Aspects of Design	6
Overview of the Design Process	7
From Marketing Goals to Engineering Requirements	8
Engineering Stages	8
Guided Iteration	8
Engineering Conceptual Design	9
The Configuration Design of Special-Purpose Parts	10
Methods for Parametric Design	11
Best Practices of Product Realization	12
Conceptual and Configuration Design of Products and Assemblies	15
Task Clarification	15
Understanding and Satisfying the Customer	17
Functional Decomposition: Modeling, Analysis, and Structure	20
Competitive Benchmarking	24
Forming Quantitative Specifications	27
Generating Design Configurations and Form Concepts	30
Product Application Example	30
Conclusions	31
Conceptual and Configuration Design of Parts Part Functions	33
Relationship of Parts to Assemblies	33
Material and Process Selection	34
Determining the Configuration	34
Qualitative Physical Reasoning to Guide Generation of Part Configuration Alternatives	34
Qualitative Reasoning about Manufacturing to Guide Generation of Part Configuration Alternatives	35
Tolerances	37
Evaluating Trial Part Configurations	38
Looking for Risks	38
Redesign Guided by Evaluations	38
Creative Concept Development	39
Definitions of Creativity	39
Understanding the Product Problem	41
Creative Concept Generation Tools	42
Applying Creative Concept Generation in New Product Design	47
Conclusions	48
Cross-Functional Design Teams	49
Background: The Changing Role of Product Design and Development in Industry	49
Types of Teams	49

Staffing a Development Team	50
Organizing a Development Team	51
The Specialist's Role on a Development Team	53
Conclusions	53

Section 2: Criteria and Concepts in Design 55

Chairperson: Bruce Boardman, Deere and Company

Concurrent Engineering	57
Concurrent Process	57
Multifunctional Teams	58
Requirements, Concepts, and Improvement	59
Conclusions	65
Designing to Codes and Standards	66
Historical Background	66
The Need for Codes and Standards	66
Purposes and Objectives of Codes and Standards	67
How Standards Develop	67
Types of Codes	67
Types of Standards	68
Codes and Standards Preparation Organizations	69
Designer's Responsibility	69
Statistical Aspects of Design	72
Clarification of Statistical Terms	73
Statistical Distributions Applied to Design	77
Statistical Procedures	81
Related ASTM Engineering Statistics Standards	86
Reliability in Design	87
Reliability Tasks	87
Instantaneous Failure Rate and General Reliability Function	87
Graphical Representation of Reliability	88
Mortality Curve	88
Mean Time to Failure	88
Mean Time between Failures	88
Useful Life	88
Series and Parallel Systems	89
Logic Diagrams	89
More Complex Parallel Systems	90
Standby Systems	91
Conditional Probability	91
Probabilistic versus Deterministic Design	91
Distributions	92
Reliability Testing	92
Human Reliability	93
Availability and Maintainability	93
Reliability Growth	93
Conclusions	94
Life-Cycle Engineering and Design	96
Life-Cycle Analysis Process Steps	96
Application of Life-Cycle Analysis Results	98
Case History: LCA of an Automobile Fender	100
Conclusions	102
Design for Quality	104
What Is Quality?	104

Management of Quality	105	Direct, Concurrent Interfacing of	
How Can Design Unfavorably Affect Product Quality?	107	Multiple-Simulation Programs	171
Evaluating a Product Design for Quality	107	Direct Interfacing of CAD Data and Simulation Programs	172
Guidelines for Promoting Quality	107	Interactions and Applications with Finite Element Analysis	172
Robust Design	110	Synthesis, Optimization, Design Guidance, Design	
The "In Spec" Dilemma	110	Improvement, and Other Factors	174
The On-Target Key	111	Mechanism Dynamics/Simulation and Concurrent	
A Philosophy of Loss	111	Engineering	174
The Quality Loss Function	112	Finite Element Analysis	176
Justifying Costs	112	A Beam Paradox	176
Parameter Design	113	The Basis of Finite Elements	178
Tolerance Design	114	Continuum Elements	178
Technology Development	114	Structural Elements	179
Orthogonal Arrays	115	Multipoint Constraints	179
Risk and Hazard Analysis in Design	117	Linear versus Nonlinear Problems	180
The Nature of Risk	117	Solution of the System of Algebraic Equations	180
Failure Mode and Effect Analysis	118	Symmetry	181
Fault Tree Analysis	120	Superelements (Substructures)	182
Event Tree Analysis	122	Finite Element Preprocessing	182
Risk/Benefit Analysis	122	Finite Element Postprocessing	183
Safety Analysis	123	Finite Element Analysis Problems and Applications	184
Probabilistic Estimates	124	Computational Fluid Dynamics	186
Conclusions	125	Introduction	186
Human Factors in Design	126	Fundamentals of Computational Fluid Dynamics	187
The Human	126	Computational Fluid Dynamics for Engineering Design	194
The Activity	126	Issues and Directions for Engineering CFD	200
The Context	126	Computer-Aided Electrical/Electronic Design	204
Human-Machine Systems	126	Functional Phase	204
Broad Design Considerations	127	Electrical Phase	204
Human-Machine Function Allocation	128	Physical Phase	207
Further Design Guidelines	128	Standards	208
Other Information Sources	130	Design Optimization	209
Environmental Aspects of Design	131	Numerical Optimization Methods	209
Generic (Structural) Concerns	131	Computer-Aided-Engineering-Based Optimal Design	211
Tools for Environmentally Responsible Design	133	Structural Optimization	214
Conclusions	138	Emerging Technologies	215
Safety in Design	139	Conclusions	217
Definitions of Safety	139	Dimensional Management and Tolerance Analysis	219
Hazard, Risk, and Danger	139	Dimensional Management Process	219
Designer's Obligation	139	General Requirements and Simulation	220
Make It Safe	139	Conclusions	221
Guarding	142	Documenting and Communicating the Design	222
Warnings	143	Background	222
Human Factors/Ergonomics	144	The Overall Design Process and General	
Products Liability and Design	146	Documentation Requirements	222
Legal Bases for Products Liability	146	Types of Documentation	224
Hazard, Risk, and Danger	147	Understanding and Using Design Documentation	228
Definitions of Defects	147	Standards	229
Preventive Measures	149	Conclusions	229
Paramount Questions	150	Rapid Prototyping	231
Acceptable Level of Danger	150	General Description	231
Section 3: Design Tools	153	Major Commercial Processes	234
<i>Chairperson: Kenneth H. Huebner, Ford Motor Company</i>		Numerical Control Machining for Prototyping	237
Computer-Aided Design	155	Analyzing Speed and Accuracy	238
Computer-Aided Design: A Brief History	155	Current Research Efforts	239
Overview of CAD Technology	156	Section 4: The Materials Selection Process	241
Constraint- and Feature-Based Computer-Aided Design	157	<i>Chairperson: George E. Dieter, University of Maryland</i>	
Data Associativity	160	Overview of the Materials Selection Process	243
Assembly Design	160	Relation of Materials Selection to Design	243
Capturing Design Intent	161	The Process of Materials Selection	244
Applications of CAD Systems	161	Performance Characteristics of Materials	245
Mechanism Dynamics and Simulation	166	Relation of Materials Selection to Manufacturing	246
Definitions and Basic Concepts	166	Costs and Related Aspects of Materials Selection	248
Performance and Function	167	Information about Materials Properties	250
Load Prediction	169	Methods of Materials Selection	251
		Conclusions	253

Techno-Economic Issues in Materials Selection	255	Effects of Composition, Processing, and Structure on	
Cost Analysis	255	Properties of Irons and Steels	357
Case Study: Cost Estimation for the Automotive		Basis of Material Selection	357
Body-in-White	257	Role of Microstructure	359
Environmental and Social Costs	261	Evolution of Microstructural Change in Steel Products	380
Conclusions	264	Effects of Composition, Processing, and Structure on	
Material Property Charts	266	Properties of Nonferrous Alloys	383
Displaying Material Properties	266	Aluminum and Aluminum Alloys	383
Types of Material Property Charts	266	Copper and Copper Alloys	389
Use of Material Property Charts	279	Nickel and Nickel Alloys	393
Performance Indices	281	Cobalt and Cobalt Alloys	396
Performance Indices and Material Property Charts	281	Titanium and Titanium Alloys	399
Case Studies in the Use of Performance Indices	285	Zinc and Zinc Alloys	404
Decision Matrices in Materials Selection	291	Magnesium and Magnesium Alloys	406
Alternatives, Criteria, and Weighting Factors	291	Beryllium and Beryllium Alloys	408
Decision Matrix Techniques	291	Refractory Metals and Alloys	409
The Pahl and Beitz Method	293	Effects of Composition, Processing, and Structure on	
Conclusions	295	Properties of Ceramics and Glasses	416
Relationship between Materials Selection and Processing	297	Glass	416
Characteristics of Manufacturing Processes	297	Traditional Ceramics	419
Influence of Materials on Manufacturing Cost	300	Engineering Ceramics	427
Design for Manufacturability	300	Effects of Composition, Processing, and Structure on	
Factors in Selecting a Material for Production	301	Properties of Engineering Plastics	434
Ease of Manufacture	302	Composition: Submolecular Structure	434
Conclusions	307	Composition: Molecular Structure	440
Computer-Aided Materials Selection	309	Composition: Intermolecular Considerations	443
Expert Systems: General Description	309	Composition: Supermolecular Considerations	445
Quantitative Selection Systems	310	Thermal and Mechanical Properties of Solid	
Qualitative and Experiential Selection Systems	311	Engineering Plastics	446
Object-Oriented Systems	312	Thermal and Mechanical Properties of Molten	
Current Status and Outlook	313	Engineering Plastics	448
Value Analysis in Materials Selection and Design	315	Viscoelasticity	448
Value Analysis versus Total Quality Management	315	Properties of Engineering Plastics and Commodity Plastics	449
Background and General Concepts	315	Electrical Properties	450
The Value Analysis Process	316	Optical Properties	451
Examples	319	Chemical Properties	452
Conclusions	321	Processing	452
Use of Failure Analysis in Materials Selection	322	Effects of Composition, Processing, and Structure on	
Relationship between Failure Analysis and		Properties of Composites	457
Materials Selection	322	Composition of Composites	458
The Failure Analysis Process	323	Manufacturing of Composites	460
Methods for Analyzing Failures to Improve		Mechanical Properties of Composites	466
Materials Selection	323	Effects of Composition Variations on Properties	467
Historical Evolution of Improved Materials	324	Effects of Processing on Properties	468
Failure Analysis Examples	324	Effects of Design Loadings and Environmental	
Conclusions	327	Conditions on Composite Properties	469
		Conclusions	469
Section 5: Effects of Composition, Processing, and		Effects of Surface Treatments on Materials Performance	470
Structure on Materials Properties	329	Solidification Surface Treatments	470
<i>Chairperson: Richard W. Heckel, Michigan Technological University</i>		Deposition Surface Treatments	476
Introduction	331	Heat Treatment Coatings	485
Composition and Structure Determine Properties	331	Sources of Materials Property Data and Information	491
Elements of Structure	331	Information Needs	492
Historical Perspective	332	Locating Sources of Data	495
Fundamental Structure-Property Relationships in		Specific Sources of Data	502
Engineering Materials	336	Evaluation and Interpretation of Data	503
Fundamental Characteristics of Metals, Ceramics,		Obtaining and Reporting Test Data	504
and Polymers	336	Conclusions	505
Crystal Structure and Atomic Coordination	337	Section 6: Properties versus Performance of Materials	507
Crystalline Defects	340	<i>Chairperson: David A. Woodford, Materials Performance analysis, Inc.</i>	
Evaluation of Mechanical Properties	342	Properties Needed for the Design of Static Structures	509
Microstructure and Low-Temperature Strength	346	Effect of Component Geometry	509
Microstructure and High-Temperature Strength	352	Factor of Safety	510
Microstructure and Low-Temperature Fracture	353	Probability of Failure	511
Microstructure and High-Temperature Fracture	354	Designing for Static Strength	512
Microstructure and Fatigue Failure	355	Designing for Stiffness	512

Selection of Materials for Static Strength	513	Design with Composites	648
Selection of Materials for Stiffness	514	Fiber-Reinforced Composite Materials	648
Types of Mechanical Failure under Static Loading at Normal Temperatures	515	Structure/Property Relationships	649
Causes of Failure of Engineering Components	515	Generic Composite Behavior	649
Design for Fatigue Resistance	516	Lamina Properties	650
The Fatigue Process	516	Laminate Properties	654
High-Cycle Fatigue	517	Metal-Matrix Composites	657
Low-Cycle Fatigue	522	Ceramic-Matrix Composites	659
Thermal Fatigue	526	Large Composite Structures: Joints, Connections, Cutting, and Repair	661
High-Temperature Behavior	527	Design for Manufacturing	664
Design for Fracture Toughness	533	Section 7: Manufacturing Aspects of Design	667
A Brief History of Fracture Mechanics	533	<i>Chairperson: Howard A. Kuhn, Concurrent Technologies Corporation</i>	
Categories of Fracture Mechanics	534	Introduction to Manufacturing and Design	669
Variables Affecting Fracture Toughness	536	The Manufacturing Enterprise	669
Analysis, Detection, and Design Criterion	539	Manufacturing Processes	671
Fracture Toughness and Design Philosophies	541	Production Systems	673
Examples of Fracture Toughness in Design	541	Interaction between Design and Manufacturing	674
The Future Direction of Fracture Toughness in Design	543	Design for Manufacture Practices	674
Design for Corrosion Resistance	545	Design for Manufacture and Assembly	676
Basic Principles of Aqueous Corrosion	545	Introduction to Design for Manufacture and Assembly	676
Forms of Corrosion and General Mitigation Approaches	548	Results of DFMA Applications	682
Engineering Design Principles	557	Roadblocks in Implementation of DFMA	683
Life Prediction and Management	565	Design for Automatic Assembly	684
Design for High-Temperature Applications	573	Conclusions	686
Historical Development of Creep Deformation Analysis	573	Manufacturing Processes and Their Selection	687
Basic Concepts of Elevated-Temperature Design	574	Product Considerations	688
Design Methodology	580	Casting Processes	689
Damage Accumulation and Life Prediction	582	Deformation Processes	691
Limitations and Alternative Design Approaches	584	Powder Processing	694
Conclusions	586	Machining Processes	695
Design for Oxidation Resistance	589	Joining Processes	696
The Oxidation Process	589	Processing of Ceramics and Glasses	698
General Methodologies	590	Polymer Processing	699
Alloy Design for Optimal Performance	591	Manufacture of Composites	701
Performance Characteristics of Superalloys	592	Manufacturing Process Selection: Example	702
Performance Characteristics of Single-Crystal Superalloys	596	Modeling of Manufacturing Processes	705
Coating Concepts for Superalloys	596	Classification of Models	705
Performance Characteristics of Other High-Temperature Materials	598	Important Aspects of Modeling	706
Degradation Due to Hot Corrosion and Particulate Ingestion	600	Modeling of Deformation Processes	707
Limitations: Testing Techniques and Life Prediction	601	Modeling of Casting Operations	710
Design for Wear Resistance	603	Modeling of Fusion Welding Processes	713
Wear Behavior	603	Conclusions	714
Lubrication	606	Manufacturing Cost Estimating	716
Material Selection for Wear Applications	607	General Concepts	716
Wear Models	608	Parametric Methods	717
Wear Design	609	Empirical Methods of Cost Estimation	718
Methods for Wear Design	612	Complexity Theory	719
Properties Needed for Electronic and Magnetic Applications	615	Cost Estimation Recommendations	722
Background Information	615	Design for Casting	723
Overview of Electric and Magnetic Parameters and Materials Properties	617	Design Considerations	723
Overview of Parameters and Materials Properties Other than Electric and Magnetic	618	The Effect of Casting Discontinuities on Properties	725
Electronic Applications	619	Casting Tolerances	727
Magnetic Applications	620	Hot Isostatic Pressing	727
Special Applications	620	Solidification Simulation and Its Use in Designing Castings	728
Design with Brittle Materials	622	Conclusions	728
Time-Independent Reliability Analyses	622	Design for Deformation Processes	730
Life Prediction Using Reliability Analyses	630	Why Use a Deformation Process?	730
Design with Plastics	639	Categories of Deformation Processes	731
Mechanical Part Performance	639	Fundamentals of Deformation Processing	731
Manufacturing Considerations	643	Flow Stress	732
Design-Based Material Selection	645	Workability	735
Conclusions	647	Formability	739
		Microstructural Effects on Metal Flow	739
		Grain Flow Pattern	741
		Flow-Related Defects in Bulk Forming	741

Defects in Sheet Metal Parts	742	Ceramic Raw Materials and Formulation	787
Conclusions	743	Preparation of Materials	787
Design for Powder Metallurgy	745	Forming Processes	788
General P/M Design Considerations	745	Drying	790
Powder Processing Techniques	745	Firing	791
Comparison of Powder Processing Methods	748	Conclusions	792
Design Issues	749	Design for Plastics Processing	793
Design for Machining	754	Plastics Processing Methods	793
Machining Costs	754	Design Features and Process Considerations	801
Types of Machining Equipment	754	Other Plastics Design and Processing Considerations	802
General Design-for-Machining Rules	755	Materials Selection Methodology	802
Special Considerations	758	Design for Composite Manufacture	804
Application of Design-for-Machining Rules	759	Composites Manufacturing Processes	804
Computer Aids	759	Process Considerations	806
Design-for-Machining Examples	760	Conclusions	809
Design for Joining	762	Control of Residual Stresses	811
Joining Processes	762	Fundamental Sources of Residual Stresses	812
Basic Design Considerations	765	Computer Prediction of Residual Stresses	814
Good Design Practices	765	Measurement of Residual Stresses	814
Case Histories	766	Residual Stresses Caused by Various Manufacturing Processes	815
Future Directions	772	Stress-Relief Methods	817
Design for Heat Treatment	774	Design for Surface Finishing	820
Overview of Component Heat Treatment	774	Design as an Integral Part of Manufacturing	820
Thermal and Transformation-Induced Strains in Heat Treated Components	775	General Design Principles Related to Surface Finishing	821
Component Design for Heat Treating: Experience-Based Design Rules	777	Surface-Preparation Processes	823
Computer Modeling as a Design Tool for Heat Treated Components	778	Organic Finishing Processes	825
Design for Ceramic Processing	781	Inorganic Finishing Processes	826
Costs	782	Conclusions	827
Design Approaches	783	Glossary of Terms	828
General Process Design	786	Metric Conversion Guide	844
		Abbreviations and Symbols	846
		Index	850
