Preface	xiii
About the Editors	xvii
About the Contributors	xix
1 Lévy Processes in Finance Distinguished by their Coarse and Fine Path Properties	1
<i>Andreas E. Kyprianou and R. Loeffen</i>	
1.1 Introduction	1
1.2 Lévy processes	2
1.3 Examples of Lévy processes in finance	4
1.3.1 Compound Poisson processes and jump-diffusions	5
1.3.2 Spectrally one-sided processes	6
1.3.3 Meixner processes	6
1.3.4 Generalized tempered stable processes and subclasses	7
1.3.5 Generalized hyperbolic processes and subclasses	9
1.4 Path properties	10
1.4.1 Path variation	10
1.4.2 Hitting points	12
1.4.3 Creeping	14
1.4.4 Regularity of the half line	16
1.5 Examples revisited	17
1.5.1 Compound Poisson processes and jump-diffusions	17
1.5.2 Spectrally negative processes	17
1.5.3 Meixner process	17
1.5.4 Generalized tempered stable process	19
1.5.5 Generalized hyperbolic process	23
1.6 Conclusions	24
References	26

2	Simulation Methods with Lévy Processes	29
	<i>Nick Webber</i>	
2.1	Introduction	29
2.2	Modelling price and rate movements	30
2.2.1	Modelling with Lévy processes	30
2.2.2	Lattice methods	31
2.2.3	Simulation methods	32
2.3	A basis for a numerical approach	33
2.3.1	The subordinator approach to simulation	34
2.3.2	Applying the subordinator approach	35
2.4	Constructing bridges for Lévy processes	36
2.4.1	Stratified sampling and bridge methods	36
2.4.2	Bridge sampling and the subordinator representation	37
2.5	Valuing discretely reset path-dependent options	39
2.6	Valuing continuously reset path-dependent options	40
2.6.1	Options on extreme values and simulation bias	42
2.6.2	Bias correction for Lévy processes	43
2.6.3	Variation: exceedence probabilities	44
2.6.4	Application of the bias correction algorithm	45
2.7	Conclusions	48
	References	48
3	Risks in Returns: A Pure Jump Perspective	51
	<i>Hélyette Geman and Dilip B. Madan</i>	
3.1	Introduction	51
3.2	CGMY model details	54
3.3	Estimation details	57
3.3.1	Statistical estimation	58
3.3.2	Risk neutral estimation	59
3.3.3	Gap risk expectation and price	60
3.4	Estimation results	60
3.4.1	Statistical estimation results	61
3.4.2	Risk neutral estimation results	61
3.4.3	Results on gap risk expectation and price	61
3.5	Conclusions	63
	References	65
4	Model Risk for Exotic and Moment Derivatives	67
	<i>Wim Schoutens, Erwin Simons and Jurgen Tistaert</i>	
4.1	Introduction	67
4.2	The models	68
4.2.1	The Heston stochastic volatility model	69
4.2.2	The Heston stochastic volatility model with jumps	69

4.2.3	The Barndorff-Nielsen–Shephard model	70
4.2.4	Lévy models with stochastic time	71
4.3	Calibration	74
4.4	Simulation	78
4.4.1	NIG Lévy process	78
4.4.2	VG Lévy process	79
4.4.3	CIR stochastic clock	79
4.4.4	Gamma-OU stochastic clock	79
4.4.5	Path generation for time-changed Lévy process	79
4.5	Pricing of exotic options	80
4.5.1	Exotic options	80
4.5.2	Exotic option prices	82
4.6	Pricing of moment derivatives	86
4.6.1	Moment swaps	89
4.6.2	Moment options	89
4.6.3	Hedging moment swaps	90
4.6.4	Pricing of moments swaps	91
4.6.5	Pricing of moments options	93
4.7	Conclusions	93
	References	95
5	Symmetries and Pricing of Exotic Options in Lévy Models	99
	<i>Ernst Eberlein and Antonis Papapantoleon</i>	
5.1	Introduction	99
5.2	Model and assumptions	100
5.3	General description of the method	105
5.4	Vanilla options	106
5.4.1	Symmetry	106
5.4.2	Valuation of European options	111
5.4.3	Valuation of American options	113
5.5	Exotic options	114
5.5.1	Symmetry	114
5.5.2	Valuation of barrier and lookback options	115
5.5.3	Valuation of Asian and basket options	117
5.6	Margrabe-type options	119
	References	124
6	Static Hedging of Asian Options under Stochastic Volatility Models using Fast Fourier Transform	129
	<i>Hansjörg Albrecher and Wim Schoutens</i>	
6.1	Introduction	129
6.2	Stochastic volatility models	131
6.2.1	The Heston stochastic volatility model	131
6.2.2	The Barndorff-Nielsen–Shephard model	132
6.2.3	Lévy models with stochastic time	133

6.3	Static hedging of Asian options	136
6.4	Numerical implementation	138
6.4.1	Characteristic function inversion using FFT	138
6.4.2	Static hedging algorithm	140
6.5	Numerical illustration	140
6.5.1	Calibration of the model parameters	140
6.5.2	Performance of the hedging strategy	140
6.6	A model-independent static super-hedge	145
6.7	Conclusions	145
	References	145
7	Impact of Market Crises on Real Options	149
	<i>Pauline Barrieu and Nadine Bellamy</i>	
7.1	Introduction	149
7.2	The model	151
7.2.1	Notation	151
7.2.2	Consequence of the modelling choice	153
7.3	The real option characteristics	155
7.4	Optimal discount rate and average waiting time	156
7.4.1	Optimal discount rate	156
7.4.2	Average waiting time	157
7.5	Robustness of the investment decision characteristics	158
7.5.1	Robustness of the optimal time to invest	159
7.5.2	Random jump size	160
7.6	Continuous model versus discontinuous model	161
7.6.1	Error in the optimal profit–cost ratio	161
7.6.2	Error in the investment opportunity value	163
7.7	Conclusions	165
	Appendix	165
	References	167
8	Moment Derivatives and Lévy-type Market Completion	169
	<i>José Manuel Corcuera, David Nualart and Wim Schoutens</i>	
8.1	Introduction	169
8.2	Market completion in the discrete-time setting	170
8.2.1	One-step trinomial market	170
8.2.2	One-step finite markets	172
8.2.3	Multi-step finite markets	173
8.2.4	Multi-step markets with general returns	174
8.2.5	Power-return assets	174
8.3	The Lévy market	177
8.3.1	Lévy processes	177
8.3.2	The geometric Lévy model	178
8.3.3	Power-jump processes	178

8.4	Enlarging the Lévy market model	179
8.4.1	Martingale representation property	180
8.5	Arbitrage	183
8.5.1	Equivalent martingale measures	183
8.5.2	Example: a Brownian motion plus a finite number of Poisson processes	185
8.6	Optimal portfolios	186
8.6.1	Optimal wealth	187
8.6.2	Examples	188
	References	192
9	Pricing Perpetual American Options Driven by Spectrally One-sided Lévy Processes	195
	<i>Terence Chan</i>	
9.1	Introduction	195
9.2	First-passage distributions and other results for spectrally positive Lévy processes	198
9.3	Description of the model, basic definitions and notations	202
9.4	A renewal equation approach to pricing	204
9.5	Explicit pricing formulae for American puts	207
9.6	Some specific examples	209
	Appendix: use of fast Fourier transform	213
	References	214
	Epilogue	215
	Further references	215
10	On Asian Options of American Type	217
	<i>Goran Peskir and Nadia Uys</i>	
10.1	Introduction	217
10.2	Formulation of the problem	218
10.3	The result and proof	220
10.4	Remarks on numerics	231
	Appendix	233
	References	234
11	Why be Backward? Forward Equations for American Options	237
	<i>Peter Carr and Ali Hirsu</i>	
11.1	Introduction	237
11.2	Review of the backward free boundary problem	239
11.3	Stationarity and domain extension in the maturity direction	242
11.4	Additivity and domain extension in the strike direction	245
11.5	The forward free boundary problem	247
11.6	Summary and future research	250

Appendix: Discretization of forward equation for American options	251
References	257
12 Numerical Valuation of American Options Under the CGMY Process	259
<i>Ariel Almendral</i>	
12.1 Introduction	259
12.2 The CGMY process as a Lévy process	260
12.2.1 Options in a Lévy market	261
12.3 Numerical valuation of the American CGMY price	263
12.3.1 Discretization and solution algorithm	263
12.4 Numerical experiments	270
Appendix: Analytic formula for European option prices	271
References	275
13 Convertible Bonds: Financial Derivatives of Game Type	277
<i>Jan Kallsen and Christoph Kühn</i>	
13.1 Introduction	277
13.2 No-arbitrage pricing for game contingent claims	279
13.2.1 Static no-arbitrage prices	279
13.2.2 No-arbitrage price processes	282
13.3 Convertible bonds	286
13.4 Conclusions	289
References	289
14 The Spread Option Optimal Stopping Game	293
<i>Pavel V. Gapeev</i>	
14.1 Introduction	293
14.2 Formulation of the problem	294
14.3 Solution of the free-boundary problem	296
14.4 Main result and proof	299
14.5 Conclusions	302
References	304
Index	307
