

Finite-Temperature
Field Theory
Principles and
Applications

Second Edition

JOSEPH I. KAPUSTA
AND
CHARLES GALE

CAMBRIDGE MONOGRAPHS
ON MATHEMATICAL PHYSICS

Contents

Preface	<i>page ix</i>
1 Review of quantum statistical mechanics	1
1.1 Ensembles	1
1.2 One bosonic degree of freedom	3
1.3 One fermionic-degree of freedom	5
1.4 Noninteracting gases	6
1.5 Exercises	10
Bibliography	11
2 Functional integral representation of the partition function	12
2.1 Transition amplitude for bosons	12
2.2 Partition function for bosons	15
2.3 Neutral scalar field	16
2.4 Bose-Einstein condensation	19
2.5 Fermions	23
2.6 Remarks on functional integrals	30
2.7 Exercises	31
Reference	31
Bibliography	31
3 Interactions and diagrammatic techniques	33
3.1 Perturbation expansion	33
3.2 Diagrammatic rules for $\lambda\phi^4$ theory	34
3.3 Propagators	38
3.4 First-order corrections to Π and $\ln Z$	41
3.5 Summation of infrared divergences	45
3.6 Yukawa theory	47

3.7	Remarks on real time perturbation theory	51
3.8	Exercises	53
	References	54
	Bibliography	54
4	Renormalization	55
4.1	Renormalizing $\lambda\phi^4$ theory	55
4.2	Renormalization group	57
4.3	Regularization schemes	60
4.4	Application to the partition function	61
4.5	Exercises	63
	References	63
	Bibliography	63
5	Quantum electrodynamics	64
5.1	Quantizing the electromagnetic field	64
5.2	Blackbody radiation	68
5.3	Diagrammatic expansion	70
5.4	Photon self-energy	71
5.5	Loop corrections to $\ln Z$	74
5.6	Exercises	82
	References	83
	Bibliography	83
6	Linear response theory	84
6.1	Linear response to an external field	84
6.2	Lehmann representation	87
6.3	Screening of static electric fields	90
6.4	Screening of a point charge	94
6.5	Exact formula for screening length in QED	97
6.6	Collective excitations	100
6.7	Photon dispersion relation	101
6.8	Electron dispersion relation	103
6.9	Kubo formulae for viscosities and conductivities	107
6.10	Exercises	114
	References	115
	Bibliography	115
7	Spontaneous symmetry breaking and restoration	117
7.1	Charged scalar field with negative mass-squared	117
7.2	Goldstone's theorem	123
7.3	Loop corrections	125
7.4	Higgs model	130

7.5	Exercises	133
	References	133
	Bibliography	134
8	Quantum chromodynamics	135
8.1	Quarks and gluons	136
8.2	Asymptotic freedom	139
8.3	<i>Perturbative evaluation of partition function</i>	146
8.4	Higher orders at finite temperature	149
8.5	Gluon propagator and linear response	152
8.6	Instantons	156
8.7	Infrared problems	161
8.8	Strange quark matter	163
8.9	<i>Color superconductivity</i>	166
8.10	Exercises	174
	References	175
	Bibliography	176
9	Resummation and hard thermal loops	177
9.1	Isolating the hard thermal loop contribution	179
9.2	Hard thermal loops and Ward identities	185
9.3	Hard thermal loops and effective perturbation theory	187
9.4	Spectral densities	188
9.5	Kinetic theory	189
9.6	Transport coefficients	193
9.7	Exercises	194
	References	194
10	Lattice gauge theory	195
10.1	Abelian gauge theory	196
10.2	Nonabelian gauge theory	202
10.3	Fermions	203
10.4	Phase transitions in pure gauge theory	206
10.5	Lattice QCD	212
10.6	Exercises	217
	References	217
	Bibliography	218
11	Dense nuclear matter	219
11.1	Walecká model	220
11.2	Loop corrections	226
11.3	Three- and four-body interactions	232
11.4	Liquid-gas phase transition	233

11.5	Summary	236
11.6	Exercises	237
	References	238
	Bibliography	239
12	Hot hadronic matter	240
12.1	Chiral perturbation theory	240
12.2	Self-energy from experimental data	248
12.3	Weinberg sum rules	254
12.4	Linear and nonlinear σ models	265
12.5	Exercises	287
	References	287
	Bibliography	288
13	Nucleation theory	289
13.1	Quantum nucleation	290
13.2	Classical nucleation	294
13.3	Nonrelativistic thermal nucleation	296
13.4	Relativistic thermal nucleation	298
13.5	Black hole nucleation	313
13.6	Exercises	315
	References	315
	Bibliography	316
14	Heavy ion collisions	317
14.1	Bjorken model	318
14.2	The statistical model of particle production	324
14.3	The emission of electromagnetic radiation	328
14.4	Photon production in high-energy heavy ion collisions	331
14.5	Dilepton production	339
14.6	J/ψ suppression	345
14.7	Strangeness production	350
14.8	Exercises	356
	References	358
	Bibliography	359
15	Weak interactions	361
15.1	Glashow–Weinberg–Salam model	361
15.2	Symmetry restoration in mean field approximation	365
15.3	Symmetry restoration in perturbation theory	369
15.4	Symmetry restoration in lattice theory	374
15.5	Exercises	377
	References	377
	Bibliography	378

16	Astrophysics and cosmology	379
16.1	White dwarf stars	380
16.2	Neutron stars	382
16.3	Neutrino emissivity	388
16.4	Cosmological QCD phase transition	394
16.5	Electroweak phase transition and baryogenesis	402
16.6	Decay of a heavy particle	408
16.7	Exercises	410
	References	411
	Bibliography	412
	Conclusion	413
	Appendix	417
A1.1	Thermodynamic relations	417
A1.2	Microcanonical and canonical ensembles	418
A1.3	High-temperature expansions	421
A1.4	Expansion in the degeneracy	423
	References	424
	<i>Index</i>	425
