

Well Logging and Geology

O. & L. SERRA

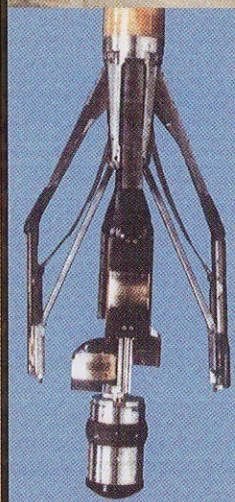

TABLE OF CONTENTS

Foreword	i	Formations of very high resistivities	73
Acknowledgements	ii	Identification of igneous rocks	74
Chapter 1		Identification of evaporites	76
Generalities	1	Identification of metamorphic rocks	85
Introduction	1	Formations with variable resistivities	86
Definitions	1	Identification of detrital rock type	86
Rock properties	1	Identification of biochemical rock type	92
Rock physical properties	1	Automatic lithology determination - LITHO-ROCKLASS	97
Rock chemical properties	2	Introduction	97
Rock geological attributes	2	Construction of the database	98
Sources of information	2	Logs used in LITHO-ROCKLASS	99
Outcrops	2	Quantitative interpretation	99
Information provided by subsurface data	4	SERRALOG approach	101
Information provided by surface seismics	4	Platform Express lithology display	106
Information provided by drilling	5	Neural network approach	112
Goal of well log interpretation	11	References and Bibliography	114
Interpretation methodology	11		
Log quality control	18	Chapter 3	
Tool calibrations	18	Well Logging and Rock Texture	119
Repeat section	18	Introduction - Review of petrographic concepts	119
Depth match	20	Definition	119
Composite-Log	21	Textural components	120
Segmentation in electrobeds	21	Texture of detrital rocks	120
Well and Logging Types	23	Grain size	120
Open holes	23	Sorting	121
Vertical wells	23	Grain shape	122
Deviated wells	23	Packing	122
Horizontal to subhorizontal wells	23	Orientation	123
Cased holes	26	Influence of grain properties	123
Conclusion	26	Influence of grain size	123
Workstations	26	Influence of sorting	124
Formation Image Examiner	27	Influence of shape and roundness of grains	125
FracView fracture synergy log	27	Influence of the orientation of grains	125
DIAMAGE	28	Influence of packing	125
GeoFrame Geology	29	Influence of the mineral composition of grains	126
Data preparation	29	Influence of other textural components	126
Geology	29	Texture of carbonate rocks	127
Petrophysics	34	Determination of textural parameters - Traditional approach	129
References and Bibliography	34	Determination of textural parameters - Well logging approach	131
		Detrital rock texture	133
Chapter 2		Grain size	133
Well Logging and Rock Composition	37	Sorting	137
Introduction - Review of general geological concepts	37	Grain orientation	138
The three major rock types	37	Arrangement or packing	139
Igneous rocks	37	Grain shape	140
Sedimentary rocks	38	Cement	140
Detrital or clastic rocks	38	Carbonate rock texture	141
Chemical and biochemical rocks	38	Porosity	141
Metamorphic rocks	38	Porosity and pore size determination from NMR	145
Relative abundance of rocks	38	Automatic extraction of textural information from dipmeter	147
Rock classification	40	Quantitative analysis of image data - BorTex program	148
Rock composition	40	Influence of textural parameters on reservoir properties	154
Elemental composition	42	References and Bibliography	155
Mineralogical composition	45		
Determination of the rock composition - Traditional method	50	Chapter 4	
Elemental and chemical composition	50	Well Logging and Rock Structure	159
Mineralogical composition	52	Introduction - Review of general geological concepts	159
Determination of the rock composition - Well logging approach	54	Definition	159
Elemental composition	55	Importance of sedimentary structures	159
Natural gamma ray spectrometry	55	Classification of sedimentary structures	159
Induced gamma ray spectrometry	57	Primary sedimentary structures	160
Determination of the mineral composition	60	Stratum, bed, lamina description	160
Exploitation of the elemental composition	61	Shape of sedimentation unit	160
Measurements involving interactions of photons	64	Nature of bed boundaries	162
Measurements of the sound wave velocities	66	Groups of beds ("bedsets")	163
Cross-plot interpretation	67	Internal organization of beds	163
Cross-plot definition	67	Secondary sedimentary structures	171
Cross-plot analysis	71	Disconformities	171

Intrusions - Dikes	171	Authigenesis	243
Diapiric structures	171	Stylolitization	243
Determination of rock structure - Traditional approach	171	The diagenetic phases	244
Determination of rock structure - Well logging approach	172	Effects of diagenesis on the sediment properties	245
Bed description	174	The need for diagenetic studies	245
Bed shape and bedding planes	174	Diagenetic Studies - Traditional methods	246
Bed thickness	175	Well logging approach	250
Nature of bed boundaries	175	Diagenesis in detrital sequences	250
Internal organization of beds	175	Compaction	250
Illustration of structures by images	180	Pressure-controlled solution	250
Bed boundaries	180	Cementation	251
Internal organization	181	Authigenesis	252
Graded bedding	183	Nodules	252
Automatic analysis of dipmeter data - The SYNDIP program	185	Pyrite crystals	253
The SYNDIP program	187	Epidiagenesis	254
Description of a SYNDIP display	188	Diagenesis in carbonate sequences	254
Rules for interpretation of dipmeter and image data	189	Crystallization	255
Quantitative analysis of image data	191	Neomorphism	255
Sedimentological applications of sedimentary structure detection	191	Selective leaching	256
References and Bibliography	193	Stylolitization	257
		Cherts and anhydritic nodules	258
		Hard-ground	259
		Diagenesis in volcanoclastic sequences	259
		Diagenesis in shales	260
		Diagenesis of organic material	260
		References and Bibliography	262
Chapter 5		Chapter 7	
Well Logging and Facies, Sequence and Environment	197	Well Logging and Compaction	265
Introduction - Review of general geological concepts	197	Introduction - Review of geological concepts	265
Definitions	197	Definition	265
Importance of facies and sequence analysis	200	Compaction study	265
Traditional approach of facies analysis	201	Sand compaction	267
Well logging approach	201	Carbonate compaction	270
Historical	203	Shale compaction	271
The Electrofacies concept	206	Principal stages in shale compaction	271
Electrofacies analysis from well logs	207	Compaction mechanisms	273
Manual identification of electrofacies	208	The Hubbert & Rubey law	273
Automatic electrofacies identification - FACIOLOG	211	Compaction effects	274
Automatic segmentation of logs	212	Effects on shale porosity	274
Clustering techniques	214	Effects on shale density	275
Final electrofacies determination	216	Effects on chemistry of interstitial fluids	275
Principal component analysis	217	Effects on geothermal gradient	276
Translation of electrofacies to facies	221	Effects on mineralogical transformation	276
Result presentation	223	The influence of time	276
The Electrosequence concept	223	Compaction of organic sediments (peats)	277
Sequence analysis from well logs	224	Compaction anomalies	277
Gradational transition - Elementary sequence	225	Definition	277
Abrupt contact	226	Origin of compaction anomalies	277
Sequences of electrofacies	227	Zones exhibiting undercompaction	278
Applications of facies and sequence analysis	227	Traditional geological approach	278
Reconstitution of the depositional environment	228	Well logging approach	278
Interest of the reconstitution of the environment	231	Associated phenomena	278
Recognition of the environments from logging data	231	Construction of the compaction profile	278
Illustration of environments from logging data	232	Manual plot	278
Reconstruction of the geometry of the facies	234	Construction of the profile at the well site	278
Mapping of electrofacies	235	DENSON automatic program	278
Constitution of a data base of electrofacies	236	Conduct of a study	279
Quantitative interpretation	236	Advantages of the DENSON program	280
Choice of a more judicious core sampling for analysis	236	Construction of the normal compaction trend	281
References and Bibliography	236	Detection of undercompacted zones by VSP	281
		Study of sand compaction using well logs	281
		Study of carbonate compaction using well logs	283
		Study of shale compaction using well logs	283
		Sonic velocity in shales	283
		Resistivity of shales	283
		Formation factor	283
		Hydrogen index of shales	284
		Capture cross-section of shales	284
		Natural gamma ray spectroscopy log	284
		Applications of compaction studies	285
		Hydrodynamic applications	285
		Detection of entry into an undercompacted formation	285
		Evaluation of formation pressure	285
Chapter 6			
Well Logging and Diagenesis	239		
Introduction - Review of geological concepts	239		
Definition	239		
The diagenetic environment	239		
Factors affecting diagenesis	240		
The fundamental processes	241		
Physical processes	241		
Chemical processes	241		
Biochemical and organic processes	241		
Diagenetic changes	241		
Rock components	242		
Compaction	242		
Cementation	242		
Recrystallization	242		
Transformation	242		
Mineralogical replacement	242		
Selective leaching	243		

Evaluation of pressure gradients	287
Geological applications	289
Detection of unconformities	289
Reconstruction of maximum burial depths	289
Differential compaction	290
Correlations between wells	290
Sedimentological applications	290
Applications to reservoir studies	292
Geophysical applications	292
Geochemical applications	293
Decompaction	293
Objectives	293
Procedures	294
Applications	294
References and Bibliography	294

Chapter 8

Well Logging and Tectonics	299
Introduction	299
Review of geological concepts	299
Definition	299
Concepts of stress	301
Mechanical behavior of rocks	303
Elastic behavior	303
Plastic behavior	305
Viscous behavior	305
Factors controlling rock behavior	306
Confining pressure	306
Temperature	306
Time	306
The actual behavior of rocks	306
Types of state of stress	307
Rock strength	307
General orientation of stresses	307
The results of stresses : strains	308
Continuous strain : fold	308
Tensile stress	308
Compressive stress	308
Descriptive elements of a fold	309
Fold shape	310
Fold type	310
Nomenclature of folds	310
Discontinuous strain : fractures and faults	311
Movements along a fault	311
Fault description	311
Fault classification	312
Determination of tectonic structures - Traditional approach	313
Determination of tectonic structures from seismic data	313
Determination of tectonic structures from gamma ray	314
Determination of tectonic structures from dipmeter or image data	315
Structural analysis of dip data	318
Statistical study of dip data	320
Dip and azimuth histograms	320
Polar plots	320
Azimuthal frequency plot	320
Density stereograms	321
Construction of density stereograms	321
Interpretation of these diagrams	322
Stereographic plotting techniques	322
Stereographic projection	322
Principle	322
Planes and lines on a stereogram	323
Polar plot	323
Cyclographic plot	323
Plotting a line	323
Construction of the WULFF stereonet	324
Construction of the SCHMIDT stereonet	324
Representation of structural elements	324
Plotting of dip data	327
Use of stereograms	328
Methods of Dip data interpretation	330
Visual arrow-plot analysis	330
"Quick-look" technique : dip patterns	330
Determining structural dip	331

Detecting faults	331
Detecting folds	332
Bengtson technique	332
Automatic and interactive programs	333
DipTrend program	333
Automatic structural dip determination	334
Analysis of borehole images	337
Structural dip versus regional or seismic dip	339
Reconstruction of the tectonic features of a well	339
Cross-section construction	340
Automatic cross-section construction	340
Hypotheses for cross-section construction	341
Similar folds versus parallel folds	341
Constructing cross-sections	342
Selecting a zone	342
Determining the structural axis and translation plane	342
Determining the cross-section plane	344
Constructing the cross-section	345
Exploitation of dip data	345
Workstations	350
Other applications of stereographic projection	351
Find the line of intersection of two planes	351
Determine the angle between two planes	351
Determination of true dip of a bed ...	351
Determination of the apparent dip ...	351
Dip removal	352
References and Bibliography	352

Chapter 9

Well Logging and Fractures	355
Introduction	355
Review of general concepts	356
Relation of fracture to stress orientation	356
Importance of fractures	358
Mechanical properties evaluation	358
Mechanical behavior of the reservoirs -	
Stress computations	358
Fracture-Pressure computations	358
Dynamic elastic properties	359
Inherent strength computations	359
Detection of fractures on cores	360
Detection of fractures from well logs	360
Natural gamma radioactivity	360
Caliper	360
Temperature	361
Formation density	362
Photoelectric capture cross-section	363
Neutron hydrogen index	363
Sonic measurements	363
Effects on body waves	363
Arrival time	364
Attenuation of body waves	364
Normalized Differential Energies (NDE)	365
Amplitude spike analysis	365
Crisscross patterns	366
Effects on Stoneley wave	367
Resistivities	368
Dipmeter	369
Resistivity curves	370
Azimuth curve of pad 1	371
Caliper	372
Dips	372
Spontaneous potential	372
Ultrasonic image tools	373
Resistivity image tools	374
Fracture evaluation	377
Depths of fractured zones	377
Type of fracture	377
Fracture orientation	378
Fracture length	378
Fracture density	378
Fracture aperture	379
Fracture porosity from images	379
Fracture porosity from photoelectric index	380

Fracture porosity from dual laterolog (DLL)	380
Determination of fracture permeability	381
Fracture effects on reservoir interpretation	381
Tortuosity factor <i>m</i>	381
Saturation evaluation	382
Formation factor - Porosity relationship	384
Lithology determination	384
Core orientation	384
Hole slippage	385
Detection of borehole damage in deviated wells	385
Relationship between stress-induced features and stress axis	387
Stress determination	388
Prediction of the fracture efficiency	390
RECAP	390
References and Bibliography	391

Chapter 10

Well Logging and Source Rock	395
Introduction	395
Traditional geological approach	395
Well logging approach	396
The Carbollog method	396
The uranium concentration	396
The $\Delta \log R$ method	396
Methods based on cross-plots	398
Methods based on nuclear measurements	399
References and Bibliography	400

Chapter 11

Well Logging and Sequence Stratigraphy	403
Introduction	403
Relative dating	403
Definition of parastratigraphic units	404
Stratigraphic phenomena	404
Break detection	404
Break definition	404
Break significance	404
Break classification	404
Breaks without major lithological change	404
Change in type of fluid	405
Textural change	405
Diagenesis	405
Tectonic accident	405
Unconformity	405
Breaks corresponding to major lithological change	406
Diagenesis together with a mineralogical change	406
Erosion	407
Unconformity	407
Ashes, lava flows or volcanic intrusions	408
Emersion	408
Transgression	408
Sequence stratigraphy from well logs	409
Nomenclature issues	409
Using log patterns	412
Simplistic use of log patterns	413
Surface hierarchy from well logs	415
Building a conceptual geological model	415
Methodology	415
Correlations from well logs	416
Principle of causality	418
Concepts of log correlation	418
Concept of similarity	418
Concept of rhythmicity	419
Concept of lateral variability	419
Intrinsic value of correlations. Concept of reliability	419
Stratigraphic value of log correlations	420
Search for time markers	420
Extension to seismic sections	421
References and Bibliography	422
Index - Glossary	423
Index of referenced authors	425
