
Computer-Aided Power Systems Analysis

Second Edition

Dr. George Kusic

CRC Press
Taylor & Francis Group

Contents

Contents vii
Preface xi

1 Central Operation and Control of Power Systems 1
1.1 General 1
1.2 Control Center of a Power System 2
1.3 Digital Computer Configuration 5
1.4 Automatic Generation Control for a Power System 7
1.4.1 Area Control Error 9
1.4.1.1 CPS1, 1 Minute Average 12
1.4.1.2 CPS2, 10 Minute Average 12
1.4.1.3 Disturbance Conditions 14
1.5 Operation without Central Computers or AGC 14
1.6 Parallel Operation of Generators 19
1.7 Network Power Flows 24
1.7.1 Oversimplified Power Flow (dc Power Flow) 25
1.8 Area Lumped Dynamic Model 30
Problems 34
References 38

2 Elements of Transmission Networks 39
2.1 Phasor Notation 40
2.2 Symmetrical Component Transformation 44
2.2.1 Floating Voltage Base Per-Unit Systems 52
2.3 Overhead Transmission Line Representation 56
2.3.1 Inductance of Long Parallel Conductors 59
2.3.2 Balanced Three-Phase Lines 65
2.3.3 Unbalanced Lines 74
2.3.4 Capacitance of Transmission Lines 76
2.3.5 General Method to Determine Aerial Transmission Line Parameters 87
2.4 Transformer Representation 97
2.4.1 Wye–Delta and Phase-Shift Transformers 100
2.4.2 Multiple-Winding Transformers 105
2.5 Synchronous Machine Representation 108
2.5.1 Steady-State Synchronous Machine Equivalent 114
2.5.1.1 Short-Circuit Characteristics 120
2.5.2 Transient Time-Frame Synchronous Machine Equivalent 120
2.5.3 Subtransient Time-Frame Synchronous Machine Equivalent 122
Problems 131
References 139

3 Bus Reference Frame 141
3.1 Linear Network Injections and Loads 142
3.2 Bus Impedance Matrix for Elements without Mutual Coupling 151
3.2.1 Adding a Tree Branch to Bus p *153*
3.2.2 Adding a Tree Branch to the Reference 155
3.2.3 Adding a Cotree Link between Buses p and q *156*
3.2.4 Adding a Cotree Link from Bus p to Reference 158
3.3 The Bus Admittance Matrix 160
3.3.1 Bus Impedance Matrix for Elements with Mutual Coupling 165
3.4 Inversion of the $\mathbf{Y}_{BUS}$ Matrix for Large Systems 169
3.4.1 Tinney's Optimally Ordered Triangular Factorization [3] 169
3.4.1.1 Tinney's Schemes for Near-Optimal Ordering 176
3.4.2 Several Iterative Methods for Linear Matrices 180
3.4.2.1 Gaussian Iteration 181
3.4.2.2 Gauss-Seidel Iteration 182
Problems 185
References 191

4 Network Fault and Contingency Calculations 193
4.1 Fault Calculations Using $\mathbf{Z}_{BUS}$ 193
4.1.1 Approximations Common to Short-Circuit Studies 204
4.2 Fault Calculations Using the $\mathbf{Y}_{BUS}$ Table of Factors 209
4.3 Contingency Analysis for Power Systems 212
4.3.1 Contingency Analysis for Power Systems 213
4.3.2 Contingencies Using $\mathbf{Z}_{BUS}$ in a Superposition Method 213
4.3.3 $\mathbf{Z}_{BUS}$ Line Contingency Method 214
4.4 Using the $\mathbf{Y}_{BUS}$ Table of Factors for Contingencies 215
4.4.1 Double Contingencies Using $\mathbf{Y}_{BUS}$ Table of Factors (Balanced Case) 219
Problems 223
References 229

5 Power Flow on Transmission Networks 231
5.1 Slack Bus 233
5.2 $\mathbf{Z}_{BUS}$ Formulation for Load-Flow Equations 234
5.3 Gauss or Gauss-Seidel Iteration Using $\mathbf{Y}_{BUS}$ 240
5.4 Newton-Raphson Iterative Scheme Using $\mathbf{Y}_{BUS}$ 243
5.4.1 Approximations to the Jacobian in the Newton-Raphson Method 257
5.5 Adjustment of Network Operating Conditions 262
5.6 Operational Power Flow Programs 275
Problems 278
References 284

6 Generator Base Power Setting 285
6.1 Economic Dispatch of Generation without Transmission Line Losses 286
6.2 Economic Dispatch of Generation with Line Losses 290
6.3 On-Line Execution of the Economic Dispatch 295
6.4 Day-Ahead Economic Dispatch with a Variable Number of Units On-Line 299
6.5 Power Transmission Line Losses for Economic Dispatch 307

6.6 Utilizing the Load-Flow Jacobian for Economic Dispatch 314
6.7 Economic Exchange of Power between Areas 320
6.7.1 Economy A Program 322
Problems 326
References 333

7 State Estimation from Real-Time Measurements 335
7.1 The Line Power Flow State Estimator 336
7.2 State Estimation and Noisy Measurements 344
7.3 Monitoring the Power System 354
7.4 Determination of Variance Σ^2 to Normalize Measurements 357
Problems 364
References 367

Appendix A: Conductor Resistance and Rating 369

Index 377
