

Condition Assessment of High Voltage Insulation in Power System Equipment

R.E. James and Q. Su

Contents

Preface	xi
1 Introduction	1
1.1 Interconnection of HV power system components	2
1.1.1 Alternating voltage systems	2
1.1.2 Direct-voltage systems	8
1.2 Insulation coordination	9
1.3 High-voltage test levels	10
1.3.1 Power-frequency voltages	13
1.3.2 Lightning-impulse voltages	13
1.3.3 Switching surges	14
1.3.4 Very fast transient tests (VFTT)	14
1.3.5 Direct-voltage tests	14
1.4 Power system developments	15
1.4.1 Reliability requirements	15
1.4.2 Condition of present assets	15
1.4.3 Extension of power system life	16
1.4.4 New systems and equipment	16
1.5 Future insulation monitoring requirements	17
1.6 Summary	17
1.7 References	17
1.8 Problems	18
2 Insulating materials utilized in power-system equipment	21
2.1 Review of insulating materials	22
2.1.1 Gases	22
2.1.2 Vacuum	25
2.1.3 Liquids	25
2.1.4 Solids	27

2.2	Characterization of insulation condition	33
2.2.1	Permittivity (ϵ) and capacitance (C)	33
2.2.2	Resistivity (ρ) and insulation resistance (IR)	33
2.2.3	Time constants	34
2.2.4	Dielectric dissipation factor	34
2.2.5	Partial discharges (PD)	35
2.2.6	Physical and chemical changes	35
2.3	Modes of deterioration and failure of practical insulating materials	36
2.3.1	Dielectric losses	37
2.3.2	Partial discharges – sources, forms and effects	39
2.3.3	Ageing effects	46
2.4	Electrical breakdown and operating stresses	48
2.5	Development of insulation applications	50
2.6	Summary	50
2.7	References	51
2.8	Standards related to insulating materials	53
2.9	Problems	54
3	Introduction to electrical insulation design concepts	55
3.1	Overview of insulation design requirements	55
3.1.1	Electrical requirements	56
3.1.2	Physical limitations	56
3.1.3	Working environment	56
3.1.4	Mechanical requirements	57
3.1.5	Thermal conditions	58
3.1.6	Processing	58
3.1.7	Reliability	59
3.2	Electric stress distributions in simple insulation systems	60
3.2.1	Multiple dielectric systems	61
3.2.2	Edge effects	64
3.2.3	Multiple electrode configurations	66
3.3	Electric stress control	68
3.4	Summary	69
3.5	References	69
3.6	Problems	70
4	Insulation defects in power-system equipment: Part 1	71
4.1	Suspension and post insulators	71
4.1.1	Suspension (string) insulators	71
4.1.2	Post insulators	73
4.2	High-voltage bushings	74
4.3	High-voltage instrument transformers	77
4.3.1	Oil-impregnated current transformers	78
4.3.2	Dry-type current transformers	80
4.3.3	Capacitor-type voltage transformers – CVT	81

4.4	High-voltage power capacitors	82
4.5	High-voltage surge arresters	83
4.6	High-voltage circuit breakers	84
4.7	Gas-insulated systems (GIS)	86
4.8	High-voltage cables	87
4.8.1	Oil-paper cables	87
4.8.2	Extruded cables	90
4.9	Summary	93
4.10	References	93
4.11	Standards related to Chapter 4	95
4.12	Problems	96
5	Insulation defects in power-system equipment: Part 2	97
5.1	Electrical rotating machines	97
5.1.1	Low-voltage motors	97
5.1.2	High-voltage machines	98
5.1.3	Possible insulation failure mechanisms in rotating machines	100
5.1.4	CIGRE summary of expected machine insulation degradation	103
5.1.5	Future of machine insulation	103
5.2	Transformers and reactors	104
5.2.1	Windings	104
5.2.2	Transformer insulation structures	106
5.3	Summary	118
5.4	References	118
5.5	Problems	120
6	Basic methods for insulation assessment	121
6.1	Generation and measurement of test high voltages	122
6.1.1	Power-frequency voltages	122
6.1.2	High-frequency voltages	127
6.1.3	Very-low-frequency voltages (VLF)	128
6.1.4	Direct voltages	128
6.1.5	Hybrid test circuits	129
6.1.6	Lightning impulse voltages	129
6.1.7	Switching surge voltages	133
6.1.8	High-voltage equipment for on-site testing	133
6.2	Non-destructive electrical measurements	135
6.2.1	Insulation resistance (IR) measurements	135
6.2.2	Measurements of the dielectric dissipation factor (DDF)	137
6.2.3	Measurement of partial discharges by electrical methods	140
6.2.4	Dielectric response measurements	147

6.3	Physical and chemical diagnostic methods	150
6.3.1	Indicators of in-service condition of oil-paper systems	150
6.3.2	Analysis of SF ₆ samples from GIS	153
6.3.3	Surface deterioration of composite insulators	153
6.3.4	Water treeing in XLPE cable insulation	153
6.3.5	Ultrasonic methods for detection of partial discharges	154
6.3.6	Miscellaneous techniques	154
6.4	Summary	154
6.5	References	154
6.6	Standards related to basic test methods	157
6.7	Problems	158
7	Established methods for insulation testing of specific equipment	159
7.1	Overhead line and substation insulators	160
7.1.1	Porcelain and glass insulators (overhead lines)	161
7.1.2	Ceramic and glass insulators (post type -- indoor and outdoor)	161
7.1.3	Composite insulators for overhead lines (string and post units)	162
7.2	Overhead line and substation hardware	162
7.3	Surge arresters	163
7.4	Switchgear	164
7.4.1	Circuit breakers	164
7.4.2	Self-protected switchgear	166
7.4.3	Disconnectors (isolators)	166
7.4.4	Metal-enclosed switchgear	166
7.4.5	Transformer tap changers	167
7.5	Bushings	167
7.6	High-voltage instrument transformers	168
7.6.1	Current transformers	168
7.6.2	Inductive voltage transformers	169
7.6.3	Capacitor voltage transformers	170
7.7	High-voltage power capacitors	171
7.8	High-voltage rotating machines	171
7.8.1	Stator bars	172
7.8.2	Assembled machine	172
7.9	High-voltage cables	173
7.9.1	Oil-impregnated cables	173
7.9.2	Extruded cables	173
7.10	Distribution and power transformers	175
7.10.1	Power-frequency overvoltage withstand tests	175
7.10.2	Partial-discharge tests	177
7.10.3	Summary of transformer HV test requirements	180

7.10.4	Additional tests	182
7.11	Dielectric testing of HVDC equipment	182
7.12	Miscellaneous items	184
7.13	Summary	184
7.14	References	184
7.15	Standards related to Chapter 7	185
7.16	Problems	188
8	Sensors for insulation condition monitoring	189
8.1	Ultra-high-frequency sensors	189
8.2	Optical-fibre sensors	190
8.2.1	Basic physics of optical-fibre sensing	193
8.2.2	Optical-fibre PD sensors	194
8.2.3	Optical-fibre temperature sensors	196
8.2.4	Advantages and disadvantages of optical-fibre sensors	199
8.3	Directional sensors for PD measurements	200
8.3.1	Directional coupler sensor	200
8.3.2	Directional field sensor	201
8.4	Summary	203
8.5	References	203
8.6	Problems	205
9	Online insulation condition monitoring techniques	207
9.1	The main problems with offline condition monitoring	207
9.2	Noise-mitigation techniques	208
9.2.1	Noise gating	209
9.2.2	Differential methods	211
9.2.3	Noise identification by signal waveform analysis	214
9.2.4	Multiple terminal PD measurements	215
9.3	Non-electrical online condition monitoring	219
9.3.1	Temperature monitoring of the insulations	219
9.3.2	Online DGA	219
9.3.3	Acoustic-based techniques for PD detection	222
9.4	Online acoustic/electric PD location methods for transformers	224
9.4.1	Acoustic transducers and winding terminal measurements	224
9.4.2	Application of internal combined acoustic and VHF/UHF transducers	224
9.5	Electrical online condition monitoring	225
9.5.1	Online dielectric dissipation factor and capacitance measurements	227
9.5.2	Online leakage current measurement	228
9.5.3	Electrical online PD detection	230
9.6	Summary	236

9.7	References	236
9.8	Problems	239
10	Artificial-intelligence techniques for incipient fault diagnosis and condition assessment	241
10.1	Database for condition assessment	241
10.1.1	A computer database and diagnostic program	242
10.1.2	A combined method for DGA diagnosis	243
10.2	Fuzzy-logic fault diagnosis	244
10.2.1	The conventional methods	245
10.2.2	A fuzzy-logic method	245
10.3	Asset analysis and condition ranking	255
10.3.1	Equipment ranking according to the insulation condition	255
10.3.2	Insulation health index	255
10.3.3	Membership functions of fuzzy set	256
10.3.4	Example of fuzzy logic condition ranking	258
10.4	Summary	262
10.5	References	263
10.6	Problems	264
	Appendix 1 List of Abbreviations	265
	Appendix 2 Major standards organizations	266
	Appendix 3 Answers to problems	267
	Index	270
