

Numerical Computation in Science and Engineering

SECOND EDITION

C. Pozrikidis

Contents

Preface	v
1 Computers and Computing	1
1.1 Analytical and numerical computation	1
1.2 Hardware and software	5
1.2.1 Hardware	5
1.2.2 Software	7
1.3 The binary system	8
1.4 The IP address	13
1.5 Binary system arithmetic	16
1.6 Computer memory and addresses	18
1.7 Computer programming	20
1.7.1 Assembly code	20
1.7.2 High-level languages	21
1.7.3 Binary executables	22
1.7.4 Recursive function calling	23
1.7.5 Evaluation of mathematical functions	24
1.8 Plots, graphs, and data visualization	26
1.9 Compiling in Unix	32
1.10 The floating point representation	35
1.10.1 Precision	36
1.10.2 Round-off error	36
1.10.3 Floating point operations	38
1.11 The hexadecimal and octal systems	40
1.12 Algorithms	42
1.12.1 Maximum and minimum of an array	43
1.12.2 Indexing	44
1.12.3 Greatest common divisor	44
1.12.4 Numerical instability	46
1.13 Algorithms and numerical efficiency	48
1.13.1 Nested multiplication by Horner's algorithm	48
1.13.2 Sorting	49

1.13.3	Binary search	51
1.13.4	The Al-Kashi algorithm	51
1.13.5	Computing π	52
1.13.6	From easy to difficult problems	52
1.14	Computer simulation	60
1.14.1	Dynamic and Monte Carlo simulation	60
1.14.2	A Monte Carlo method for computing π	61
1.14.3	Buffon's needle	63
1.14.4	Assessing whether a point lies inside a region in a plane	65
1.14.5	Assessing whether a point lies inside a volume in space	67
1.14.6	Numerical evidence	67
1.15	Simulation of stochastic and random processes	69
1.15.1	Random walkers with constant steps	69
1.15.2	Random walkers with continuous steps	76
1.15.3	Random sequences with a specified pdf	77
1.15.4	Box-Muller transformation	81
1.16	Numerical error and its reduction	82
1.16.1	Absolute and relative error	82
1.16.2	Order of a method	83
1.16.3	Assessing the order of a method	84
1.16.4	Error reduction by Richardson extrapolation	86
1.17	Iterations, numerical sequences, and their convergence	88
1.17.1	Acceleration of convergence	88
2	Numerical Matrix Algebra and Matrix Calculus	94
2.1	Matrices	94
2.1.1	Transpose of a matrix	95
2.1.2	Adjoint of a matrix	96
2.1.3	Vectors are slender matrices	97
2.1.4	Matrix algebra	97
2.1.5	Vector transformations	101
2.1.6	Gram-Schmidt orthogonalization	103
2.1.7	Matrix functions and their derivatives	107
2.2	Square matrices	109
2.2.1	Symmetric and skew-symmetric matrices	110
2.2.2	Hermitian or self-adjoint matrices	111
2.2.3	Skew-Hermitian matrices	112
2.2.4	Matrices with a special structure	112
2.2.5	Positive-definite matrices	117
2.2.6	Trace	119
2.3	Matrix inverse, cofactors, and the determinant	120
2.3.1	Matrix inverse	120
2.3.2	The Woodbury and Sherman-Morrison formulas	121
2.3.3	Inverse of a diagonal matrix	122

2.3.4	Minors, cofactors, and the determinant	122
2.3.5	Inverse in terms of the cofactors and the matrix adjoint	124
2.3.6	Orthogonal matrices	125
2.3.7	Unitary matrices	126
2.3.8	Plane rotation with Givens matrices	126
2.3.9	Reflection with Householder matrices	127
2.3.10	Matrix functions	128
2.4	Computation of the determinant	130
2.5	Computation of the matrix inverse	135
2.5.1	Inverse by columns	135
2.5.2	Inverse from the LU decomposition	135
2.5.3	Inverse from the QR decomposition	138
2.5.4	Improving an approximation to the inverse	138
2.6	LU and related decompositions	140
2.6.1	Doolittle decomposition	141
2.6.2	LDU decomposition	144
2.6.3	Tridiagonal matrices	144
2.6.4	Crout decomposition	145
2.6.5	Pivoting and Gauss elimination	147
2.6.6	Cholesky decomposition	147
2.7	QR decomposition	150
2.7.1	QR decomposition with Gram-Schmidt orthogonalization	151
2.7.2	QR decomposition by reflection	152
2.7.3	QR decomposition by Givens rotation	156
2.8	Systems of linear algebraic equations	158
2.8.1	Cramer's rule	160
2.8.2	Singular matrices and linear mapping	160
2.8.3	Singular systems	161
2.8.4	Homogeneous systems and null space	162
2.9	Matrix eigenvalues	163
2.9.1	The characteristic polynomial	164
2.9.2	Relationship between the eigenvalues, the trace, and the determinant	165
2.9.3	Powers, inverse, and functions of a matrix	165
2.9.4	Hermitian matrices	166
2.9.5	Approximate location of eigenvalues	166
2.9.6	Coefficients of the characteristic polynomial	167
2.9.7	Diagonal matrix of eigenvalues	167
2.10	Eigenvectors and principal vectors	169
2.10.1	Properties of eigenvectors	169
2.10.2	Principal vectors	169
2.10.3	Left eigenvectors	170
2.10.4	Matrix of eigenvectors	171
2.10.5	Normal matrices	172
2.10.6	Eigenvalues and eigenvectors of the adjoint	172

2.10.7	Eigenvalues of positive-definite Hermitian matrices	172
2.11	Similarity transformations, diagonalization, and the Jordan canonical form	173
2.11.1	Schur normal form	175
2.11.2	Similarity of tridiagonal matrices	175
2.11.3	Matrix diagonalization	176
2.11.4	Jordan canonical form	177
2.11.5	Jordan projection matrix	178
2.11.6	The Jordan form is a zero of the characteristic polynomial	180
2.12	Wielandt deflation	182
2.13	Linear mapping	185
2.13.1	Evolution of a vector subject to successive mapping	186
2.14	Matrix functions	188
2.14.1	The Cayley-Hamilton theorem	189
2.14.2	Characteristic polynomial based on a Krylov sequence	190
2.14.3	The exponential function	191

3 Linear Algebraic Equations 193

3.1	Significance and applications	193
3.1.1	Forces on the elements of a crane truss	194
3.1.2	Mass balance around a dual separation process	195
3.1.3	Temperature distribution in a plate	198
3.2	Diagonal and triangular systems	206
3.2.1	Diagonal systems	207
3.2.2	Lower triangular systems and forward substitution	207
3.2.3	Upper triangular systems and backward substitution	208
3.2.4	Block-diagonal and block-triangular systems	209
3.3	General procedures and overview	210
3.3.1	Iterative methods	212
3.3.2	Solution improvement	212
3.3.3	Sparse systems	213
3.3.4	Overdetermined systems	214
3.3.5	Singular systems with an infinity of solutions	214
3.3.6	Sensitivity and the condition number	216
3.3.7	Systems with complex numbers	217
3.4	Tridiagonal systems	218
3.4.1	Heat conduction distribution along a pipe	218
3.4.2	Thomas algorithm	220
3.4.3	Simplified Gauss elimination	224
3.5	Pentadiagonal systems	225
3.5.1	Beam bending	225
3.5.2	Generalized Thomas algorithm	227
3.6	Cyclic reduction	229
3.7	Nearly easy systems	234

3.7.1	Sherman-Morrison decomposition	235
3.7.2	Provisional Thomas algorithm	237
3.8	Gauss elimination and related methods	238
3.8.1	Pivoting	239
3.8.2	Algorithm with row pivoting	240
3.8.3	Preconditioning	247
3.8.4	Pivoting and permutation matrices	248
3.8.5	Multiple right-hand sides	249
3.8.6	Computation of the inverse	249
3.8.7	Gauss-Jordan reduction	249
3.9	Iterative methods	252
3.9.1	Fixed-point iterations for one equation	252
3.9.2	Fixed-point iterations for a system of equations	254
3.9.3	Jacobi method	257
3.9.4	Gauss-Seidel method	258
3.9.5	Weighted residual correction	259
3.9.6	Weighted Jacobi iterations	260
3.9.7	Successive overrelaxation (SOR)	260
3.9.8	Richardson iterations	262
3.9.9	Operator- and grid-based splitting	262
3.9.10	Acceleration of iterations by deflation	263
3.10	Minimization and residual methods	267
3.10.1	Steepest-descent search	268
3.10.2	Directional search	270
3.10.3	Conjugate gradients	272
3.10.4	Biconjugate gradients	277
3.10.5	Other methods	280

4 Nonlinear Algebraic Equations 281

4.1	Mathematical and physical context	281
4.1.1	One equation	281
4.1.2	Two equations	285
4.1.3	Many equations	286
4.2	Formalism and general procedures	288
4.2.1	Estimating the location of a root	290
4.2.2	Estimating the roots of polynomials	291
4.3	Bracketing methods	293
4.4	Fixed-point iterations	294
4.4.1	Iterated mapping	294
4.4.2	Fixed-point iterations for one equation	296
4.4.3	Fixed-point iterations for a system of equations	302
4.5	Newton's and related methods for one equation	306
4.5.1	Secant method	310
4.5.2	Muller's method	312

4.5.3	Regula-falsi method	314
4.5.4	Cubic and high-order convergence	315
4.6	Newton's and related methods for a system of equations	317
4.6.1	Newton iteration function	317
4.6.2	Quasi-Newton methods	320
4.6.3	Broyden's method	321
4.7	Roots of polynomials	326
4.7.1	Bairstow's method	328
4.7.2	Laguerre's method	331
4.7.3	Other methods	332
4.8	Difficult problems, continuation, and embedding	333
5	Eigenvalues of Matrices	335
5.1	Mathematical and physical context	335
5.1.1	Inclination of an elongated body	335
5.1.2	Vibration of bodies connected by springs	336
5.1.3	Eigenvalue problems from differential equations	337
5.1.4	Periodic solutions of Mathieu's equation	338
5.1.5	Complex matrices	342
5.1.6	Generalized eigenvalue problems	343
5.1.7	Nonlinear eigenvalue problems	347
5.2	Diagonal, triangular, tridiagonal, circulant, and Hessenberg matrices	349
5.2.1	Diagonal and triangular matrices	349
5.2.2	Tridiagonal matrices with constant diagonal elements	349
5.2.3	Tridiagonal matrices whose eigenvalues are roots of orthogonal polynomials	352
5.2.4	Circulant matrices	354
5.2.5	Hessenberg matrices	355
5.3	Roots of the characteristic polynomial	357
5.3.1	Evaluation of the characteristic polynomial	358
5.3.2	Hydrodynamic stability	358
5.4	The power method	361
5.4.1	Computing further eigenvalues	365
5.5	Similarity transformations	369
5.5.1	Reduction of symmetric matrices	371
5.5.2	Reduction of arbitrary matrices	385
6	Function Interpolation and Differentiation	391
6.1	Interpolation condition and interpolation types	391
6.2	Vandermonde interpolation	392
6.3	Newton interpolation	396
6.4	Neville and Aitken interpolation	398
6.4.1	Neville interpolation	398
6.4.2	Aitken interpolation	400

6.5	Lagrange interpolation	402
6.5.1	Cauchy relations	405
6.5.2	Representation in terms of the Lagrange generating polynomial	406
6.5.3	Evenly spaced data	407
6.5.4	Inverse Lagrange interpolation	407
6.5.5	Cardinal interpolation functions	408
6.6	Properties of Lagrange polynomials	410
6.6.1	Derivatives	410
6.6.2	Node differentiation matrix	410
6.6.3	Representation in terms of the Vandermonde matrix	413
6.6.4	Representation in terms of the generalized Vandermonde matrix	414
6.6.5	Inverse of the Vandermonde matrix	415
6.6.6	Lagrange polynomials corresponding to polynomial roots	416
6.7	Lagrange projection matrices	417
6.8	Error and convergence of polynomial interpolation	421
6.8.1	Interpolation error	421
6.8.2	Convergence	422
6.8.3	The Lebesgue constant	424
6.9	Optimal polynomial interpolation	427
6.10	Lobatto interpolation	432
6.11	Selection of the interpolation variable	435
6.12	Local polynomial interpolation	436
6.12.1	Linear interpolation	436
6.12.2	Quadratic interpolation	438
6.12.3	Cubic interpolation	440
6.13	Cubic-spline interpolation	440
6.13.1	One interval	440
6.13.2	Two intervals	442
6.13.3	Arbitrary number of intervals	445
6.13.4	Applications	454
6.14	Lagrange interpolation for high-multiplicity data	456
6.14.1	Generalized Lagrange polynomials	456
6.14.2	Dual multiplicity data	459
6.15	Lagrange projection matrices with multiple eigenvalues	460
6.15.1	Diagonalizable matrices	462
6.15.2	Nondiagonalizable matrices	462
6.16	Hermite interpolation	465
6.16.1	Interpolating polynomial with matching slopes	466
6.16.2	High-order Hermite interpolation	467
6.17	Parametric representation of lines	473
6.17.1	Global representation and interpolation	473
6.17.2	Local interpolation, cubic splines, and circular arcs	475
6.17.3	Which method?	481

6.18	Numerical differentiation	482
6.18.1	Formulas from linear interpolation	483
6.18.2	Formulas from quadratic interpolation	484
6.18.3	Formulas from high-order interpolation	485
6.18.4	Tables of finite-difference formulas	487
6.18.5	Finite-difference formulas from the node differentiation matrix	490
6.19	Interpolation in two variables	497
6.19.1	Bivariate interpolation through a Cartesian grid	497
6.19.2	Interpolation through a triangular grid	500
6.19.3	Interpolation from scattered data	504
6.20	Numerical partial differentiation	507
6.20.1	Cartesian grids	507
6.20.2	Isotropic triangular grids	511
6.21	Surface interpolation	512
6.21.1	Representation with triangles	514
7	Numerical Integration	517
7.1	One-dimensional integrals	517
7.2	Integration by local polynomial interpolation	523
7.2.1	Trapezoidal rule	524
7.2.2	Euler-Maclaurin formula	528
7.2.3	Trapezoidal rule for periodic functions	530
7.2.4	Simpson's 1/3 rule	530
7.2.5	Simpson's 3/8, Boole's, and higher-order rules	533
7.2.6	Seemingly singular integrands	534
7.2.7	Midpoint rule and open formulas	535
7.2.8	Integrands with singular derivatives	535
7.3	Gauss-Legendre quadrature	538
7.3.1	Canonical form	538
7.3.2	Lagrange interpolation	539
7.3.3	Optimization	539
7.4	Gaussian integration quadratures	546
7.4.1	Computation of quadrature weights	548
7.4.2	Quadrature weights based on optimality	549
7.4.3	Formulas and tables of base points and weights	549
7.4.4	Gauss-Legendre quadrature	549
7.4.5	Gauss-Chebyshev quadrature	550
7.4.6	Gauss-log quadrature	550
7.4.7	Gauss-Laguerre quadrature	552
7.4.8	Generalized Gauss-Laguerre quadrature	555
7.4.9	Gauss-Hermite quadrature	556
7.4.10	Gauss-Chebyshev quadrature of the second kind	559
7.4.11	Advanced quadratures	559
7.5	Constrained integration quadratures	560

7.5.1	Radau quadrature	560
7.5.2	Lobatto quadrature	563
7.5.3	Chebyshev second-kind quadrature	567
7.6	Singular integrands	569
7.6.1	Product-integration rules	574
7.6.2	Gauss-Chebyshev quadrature for integrands with an $x^{-1/2}$ singularity . . .	575
7.6.3	Integrands with a logarithmic singularity	576
7.7	Integrals over infinite domains	577
7.8	Rapidly varying and oscillatory integrands	580
7.9	Fredholm integral equations	582
7.9.1	Nystrom method	583
7.9.2	Fredholm method	584
7.9.3	Heat conduction from an isothermal body	586
7.10	Areal integrals	587
7.10.1	Product-integration rules	588
7.10.2	Integral over a rectangle	589
7.10.3	Integral over a quadrilateral	592
7.11	Integral over a triangle	593
7.11.1	Flat triangles	593
7.11.2	Curved triangles	602
7.12	Quadratures for miscellaneous shapes	603

8 Function Approximation 606

8.1	Polynomial approximation	606
8.1.1	Taylor series approximation	606
8.1.2	Weierstrass approximation	608
8.2	Least-squares minimization	612
8.2.1	Least-squares polynomials	613
8.2.2	Approximation with orthogonal polynomials	616
8.3	Bézier approximation	620
8.3.1	Bézier segments	620
8.3.2	Bézier splines	623
8.3.3	Bézier surfaces	623
8.4	B-spline approximation	624
8.4.1	Influence functions	625
8.4.2	Linear B-splines	626
8.4.3	Quadratic B-splines	626
8.4.4	Cubic B-splines	628
8.4.5	High-order B-splines	630
8.4.6	B-spline representation of lines and surfaces	632
8.5	Padé approximation	636
8.6	Trigonometric approximation and interpolation	640
8.6.1	Fourier projection	641

8.6.2	Fourier coefficients by the trapezoidal rule	643
8.6.3	Cosine Fourier series	647
8.6.4	Sine Fourier series	649
8.6.5	Which Fourier series?	652
8.7	Fast Fourier transform	652
8.7.1	FFT for $N = 2$	654
8.7.2	FFT for $N = 4$	654
8.7.3	FFT for $N = 8$	657
8.7.4	FFT for $N = 2^s$	660
8.7.5	Implementation	662
8.8	Fourier approximation of a function of two variables	665
8.8.1	Evenly spaced points	666
8.8.2	Periodic functions	670
8.9	Exponential fitting with Prony's method	671
9	Ordinary Differential Equations	678
9.1	Problem formulation and physical context	678
9.1.1	Vector formulation	679
9.1.2	Equations of higher order	680
9.1.3	Evolution equations and dynamical systems	683
9.1.4	Start-up of a chemical reactor	683
9.1.5	Evolution of an ecosystem	685
9.1.6	Phase space and solution orbits	686
9.1.7	The Lorenz system	688
9.2	Initial-value problems	691
9.2.1	Stability of an equilibrium point	692
9.2.2	Ill-conditioned or inherently unstable systems	693
9.2.3	Chaos	694
9.3	Linear autonomous systems	694
9.3.1	Diagonal systems	695
9.3.2	Triangular systems	695
9.3.3	Systems with diagonalizable matrices	695
9.3.4	Systems with nondiagonalizable matrices	702
9.4	Numerical approximations	709
9.4.1	Euler method	710
9.4.2	Implicit Euler method	711
9.4.3	Crank-Nicolson method	711
9.4.4	Modified Euler method (RK2)	712
9.4.5	Third-order Runge-Kutta method (RK3)	713
9.4.6	Fourth-order Runge-Kutta method (RK4)	715
9.4.7	Midpoint method	715
9.4.8	Second-order Adams-Bashforth method	716
9.5	Time stepping and successive mapping	717
9.5.1	Numerical diffusion or damping	719

9.5.2	Numerical instability	719
9.5.3	Stability graphs	720
9.5.4	Stiff equations	723
9.6	Integration of nonlinear equations	723
9.6.1	Euler's method	724
9.6.2	Implicit and semi-implicit Euler methods	724
9.6.3	Crank-Nicolson method	725
9.6.4	Adams-Bashforth methods	725
9.6.5	Adams-Moulton methods	728
9.6.6	Midpoint methods	730
9.6.7	Störmer-Verlet algorithm for second-order systems	731
9.6.8	Other methods	732
9.7	Time stepping and algebraic mapping	733
9.8	Predictor-corrector methods	735
9.8.1	Multipoint and Runge-Kutta methods	736
9.8.2	Adams-Bashforth-Moulton methods	736
9.8.3	Runge-Kutta methods	737
9.8.4	Second-order Runge-Kutta method (RK2)	738
9.8.5	Third-order Runge-Kutta method (RK3)	739
9.8.6	Fourth-order Runge-Kutta method (RK4)	744
9.9	A particle straddling a fluid interface	749
9.10	Error estimate and adaptive control	760
9.10.1	Runge-Kutta-Fehlberg second and third order methods (RK23)	760
9.10.2	Runge-Kutta-Fehlberg fourth and fifth order methods (RK45)	762
9.11	Stiff equations	763
9.11.1	Numerical methods for stiff systems	764
9.12	Boundary-value, free-boundary, and eigenvalue problems	766
9.12.1	Two-point boundary-value problems	766
9.12.2	Separated boundary conditions	767
9.12.3	Nonseparated boundary conditions	770
9.12.4	Numerical methods	771
9.12.5	Free-boundary problems	771
9.12.6	Eigenvalue problems	773
9.13	The shooting method	774
9.13.1	A bubble or liquid drop on a surface	775
9.13.2	Implementation of Newton's method	783
9.13.3	Scaling	787
9.13.4	Linear systems and superposition	788
9.13.5	Partial inverse shooting	789
9.13.6	Unseparated boundary conditions	790

10 Discretization Methods for Ordinary Differential Equations **792**

10.1	Finite-difference methods	792
10.1.1	Implementation	792

10.1.2	To beat a drum with a finite-difference method	796
10.1.3	Nonlinear equations	799
10.2	Multigrid methods	800
10.2.1	Two-grid scheme	801
10.2.2	Poisson equation in one dimension	802
10.2.3	Smoothing efficiency	804
10.2.4	Effective projection matrix of the two-grid scheme	810
10.2.5	Multigrid V cycle	815
10.2.6	Explicit V cycle multigrid code	816
10.2.7	Recursive V cycle multigrid code	822
10.2.8	W cycles	825
10.2.9	Full multigrid cycle (FMG)	825
10.3	Finite-volume methods	826
10.3.1	Element discretization	826
10.3.2	Finite-volume formulation	832
10.4	Weighted-residual methods	834
10.4.1	Galerkin and Lanczos's tau methods	835
10.4.2	Spectral methods	839
10.4.3	Collocation methods	841
10.5	Finite-element methods	845
10.5.1	Linear element interpolation	846
10.5.2	Element grading	847
10.5.3	Galerkin projection	847
10.5.4	Formulation of a linear algebraic system	848
10.5.5	Relation to the finite difference method	851
10.5.6	Flux at the Dirichlet end	852
10.5.7	Galerkin finite-element equations by way of Dirac's delta function	853
10.5.8	Element diffusion and mass matrices	854
10.5.9	Assembly	858
10.5.10	Finite-element code	858
10.5.11	Quadratic and spectral elements	864

11 Finite-Difference Methods for Partial Differential Equations 865

11.1	Convection-diffusion-reaction equation	865
11.1.1	Classification	867
11.1.2	Initial and boundary conditions	867
11.1.3	Heat conduction through a rod	868
11.1.4	Vectorial convection-diffusion-reaction equation	869
11.1.5	Origin of the Laplacian	869
11.2	Finite-difference formulation	871
11.2.1	Conservative form	874
11.3	Grid generation	876
11.3.1	Conformal mapping	879
11.3.2	Transformation of governing equations	888

11.3.3	Numerical grid generation	891
11.4	Explicit methods for one-dimensional unsteady diffusion	893
11.4.1	Reduction to ODEs	894
11.4.2	Time-space discretization	895
11.4.3	FTCS discretization	896
11.4.4	CTCS (leap-frog) discretization	902
11.4.5	The Du Fort and Frankel method	903
11.4.6	Summary	904
11.4.7	Heat conduction across two layers	904
11.5	Implicit methods for one-dimensional unsteady diffusion	910
11.5.1	Implicit BTCS or Laasonen method	910
11.5.2	The Crank-Nicolson method	913
11.5.3	Three-level implicit methods	915
11.6	Explicit methods for unsteady diffusion in two and three dimensions	917
11.6.1	Fully explicit FTCS discretization	917
11.6.2	Temperature distribution in a chimney wall	918
11.6.3	Temperature distribution across a cooling rod in microelectronics	923
11.6.4	Assessment of explicit methods	929
11.7	Implicit methods for unsteady diffusion in two and three dimensions	929
11.7.1	BTCS discretization	930
11.7.2	Crank-Nicolson discretization	931
11.7.3	ADI method in two dimensions	932
11.7.4	ADI method in three dimensions	933
11.7.5	Operator splitting and fractional steps	936
11.8	Finite-volume method	937
12	Finite-Difference Methods for the Poisson and Laplace Equations	940
12.1	Finite-difference implementation	940
12.1.1	Direct solution	940
12.1.2	Transient approach to steady state	941
12.2	Poisson equation in a rectangular domain	944
12.3	Mollified color function for an immersed boundary	958
12.4	Steady temperature distribution across a chimney wall	967
12.5	Fluid flow in a cavity	973
12.6	Solution in curvilinear coordinates	982
12.7	Shear flow over a bumpy wall	989
12.8	Nonlinear Poisson equation	997
12.9	Multigrid methods	1006
12.9.1	Two-grid method	1006
12.9.2	Prolongation	1008
12.9.3	Restriction	1008
12.9.4	Multigrid V cycle	1009

13 Finite-Difference Methods for Convection–Diffusion	1017
13.1 One-dimensional convection	1017
13.1.1 Particle method	1021
13.1.2 Shocks	1022
13.2 Finite-difference methods	1025
13.2.1 Linear convection	1026
13.2.2 Explicit FTCS discretization	1026
13.2.3 FTBS method	1029
13.2.4 FTFS method	1032
13.2.5 Upwind differencing, numerical diffusivity, and the CFL condition	1032
13.2.6 Numerical diffusion	1033
13.2.7 Numerical cone of influence	1034
13.2.8 Lax’s modification of the FTCS method	1034
13.2.9 The Lax-Wendroff method	1035
13.2.10 Explicit CTCS or leapfrog method	1037
13.2.11 Implicit BTCS	1038
13.2.12 Crank-Nicolson method	1039
13.2.13 Summary	1040
13.2.14 Modified dynamics and explicit numerical diffusion	1040
13.2.15 Multistep methods	1040
13.3 Nonlinear convection	1042
13.3.1 Burgers equation	1042
13.3.2 Finite-volume method	1044
13.4 Convection in two and three dimensions	1046
13.4.1 Fully explicit FTCS discretization	1047
13.4.2 Lax’s method	1047
13.4.3 Implicit methods	1049
13.4.4 Operator splitting and fractional steps	1049
13.5 Explicit methods for convection–diffusion in one dimension	1050
13.5.1 FTCS discretization	1050
13.5.2 Upwind differencing	1053
13.5.3 Generalized upwind differencing	1054
13.5.4 Higher-order methods	1055
13.5.5 Explicit CTCS and the Du Fort and Frankel method	1056
13.6 Implicit methods for convection–diffusion in one dimension	1057
13.6.1 BTCS discretization	1057
13.6.2 Crank-Nicolson method	1057
13.6.3 Two-level implicit methods	1058
13.6.4 Three-level fully implicit methods	1058
13.7 Multistep and related methods for convection–diffusion in one dimension	1059
13.7.1 Operator splitting and fractional steps	1059
13.7.2 Hopscotch	1060
13.7.3 Nonlinear convection diffusion	1060

13.8	Convection-diffusion in two and three dimensions	1062
13.8.1	Unsteady flow in a cavity	1064
13.9	Computational fluid dynamics	1066
13.9.1	Alternative system of governing equations	1067
13.9.2	Pressure boundary conditions	1068
13.9.3	Compatibility condition for the pressure	1068
13.9.4	Operator splitting and solenoidal projection	1068
13.9.5	Convection–diffusion step	1070
13.9.6	Projection step	1071
13.9.7	Boundary conditions for the intermediate velocity	1073
13.9.8	Flow in a cavity	1073
14	Boundary-Element Methods	1081
14.1	Laplace’s equation in two dimensions	1082
14.1.1	Green’s first and second identities and the reciprocal relation	1082
14.1.2	Green’s functions	1083
14.1.3	Free-space Green’s function	1084
14.1.4	Integral properties of the Green’s functions	1085
14.1.5	Integral representation	1085
14.1.6	Green’s third identity	1086
14.1.7	Integral equations	1086
14.1.8	Boundary-element collocation method	1088
14.2	Contour discretization	1088
14.2.1	Linear elements	1089
14.2.2	Circular elements	1092
14.2.3	Discretization code	1096
14.3	Influence coefficients	1099
14.4	Temperature distribution across a chimney wall	1104
15	Finite-Element Methods for Partial Differential Equations	1113
15.1	General framework	1113
15.2	Convection–diffusion in two dimensions	1114
15.2.1	Galerkin projection	1116
15.2.2	Domain discretization and interpolation	1117
15.2.3	GFEM equations	1118
15.2.4	Implementation of the Dirichlet boundary condition	1120
15.3	Three-node triangles	1122
15.3.1	Element matrices	1123
15.4	Grid generation	1127
15.4.1	Successive subdivisions	1127
15.4.2	Delaunay triangulation	1132
15.4.3	Generalized connectivity matrices	1135
15.4.4	Element and node numbering	1136
15.5	Code for Laplace’s equation	1138
