Contents

	Preface	ix
1	The Power of Statistical Tests	1
	The Structure of Statistical Tests	2
	The Mechanics of Power Analysis	9
	Statistical Power of Research in the Social and Behavioral Sciences	17
	Using Power Analysis	19
	Hypothesis Tests Versus Confidence Intervals	23
	Summary	24
2	A Simple and General Model for Power Analysis	25
	The General Linear Model, the F Statistic, and Effect Size	27
	The F Distribution and Power	29
	Using the Noncentral F Distribution to Assess Power	32
	Translating Common Statistics and ES Measures Into F	33
	Defining Large, Medium, and Small Effects	38
	Nonparametric and Robust Statistics	39
	From F to Power Analysis	40
	Analytic and Tabular Methods of Power Analysis	41
	Using the One-Stop F Table	42
	The One-Stop F Calculator	45
	Summary	47
3	Power Analyses for Minimum-Effect Tests	49
	Implications of Believing That the Nil Hypothesis Is Almost Always Wrong	53
	Minimum-Effect Tests as Alternatives to Traditional Null Hypothesis Tests	56

Testing the Hypothesis That Treatment Effects Are Negligible	59
Using the One-Stop Tables to Assess Power to Test Minimum-Effect Hypotheses	64
Using the One-Stop <i>F</i> Calculator for Minimum-Effect Tests	67
Summary	68
4 Using Power Analyses	71
Estimating the Effect Size	72
Four Applications of Statistical Power Analysis	77
Calculating Power	78
Determining Sample Sizes	79
Determining the Sensitivity of Studies	81
Determining Appropriate Decision Criteria	82
Summary	87
5 Correlation and Regression	89
The Perils of Working With Large Samples	90
Multiple Regression	92
Power in Testing for Moderators	96
Why Are Most Moderator Effects Small?	97
Implications of Low Power in Tests for Moderators	99
Summary	100
6 <i>t</i>-Tests and the Analysis of Variance	101
The <i>t</i> -Test	101
Independent Groups <i>t</i> -Test	103
Traditional Versus Minimum-Effect Tests	105
One-Tailed Versus Two-Tailed Tests	107
Repeated Measures or Dependent <i>t</i> -Test	108
The Analysis of Variance	110
Which Means Differ?	113
Summary	116
7 Multifactor ANOVA Designs	117
The Factorial Analysis of Variance	118
Factorial ANOVA Example	124
Fixed, Mixed, and Random Models	126
Randomized Block ANOVA: An Introduction to Repeated-Measures Designs	128
Independent Groups Versus Repeated Measures	129
Complexities in Estimating Power in Repeated-Measures Designs	134
Summary	135
8 Split-Plot Factorial and Multivariate Analyses	137
Split-Plot Factorial ANOVA	137

Power for Within-Subject Versus Between-Subject Factors	140
Split-Plot Designs With Multiple Repeated-Measures Factors	141
The Multivariate Analysis of Variance	141
Summary	144
9 The Implications of Power Analyses	145
Tests of the Traditional Null Hypothesis	146
Tests of Minimum-Effect Hypotheses	147
Power Analysis: Benefits, Costs, and Implications for Hypothesis Testing	151
Direct Benefits of Power Analysis	151
Indirect Benefits of Power Analysis	153
Costs Associated With Power Analysis	154
Implications of Power Analysis: Can Power Be Too High?	155
Summary	157
References	159
Appendices	163
Author Index	209
Subject Index	211
