

Roy Langton

Stability and Control of Aircraft Systems

Introduction to Classical Feedback Control

Aerospace Series

Editors Ian Moir, Allan Seabridge and Roy Langton

 **WILEY**

Contents

Series Preface	ix
Preface	xi
1 Developing the Foundation	1
1.1 Engineering Units	2
1.1.1 <i>International System of Units (SI)</i>	2
1.1.2 <i>US/Imperial Units System</i>	3
1.1.3 <i>Comparing the SI and US/Imperial Units Systems</i>	4
1.2 Block Diagrams	4
1.2.1 <i>Examples of Summation (or Comparison) Devices</i>	5
1.3 Differential Equations	11
1.3.1 <i>Using the ‘D’ Notation</i>	12
1.4 Spring–Mass System Example	14
1.4.1 <i>The Standard Form of Second-order System Transfer Function</i>	15
1.5 Primer on Complex Numbers	18
1.5.1 <i>The Complex Sinusoid</i>	19
1.6 Chapter Summary	21
2 Closing the Loop	23
2.1 The Generic Closed Loop System	23
2.1.1 <i>The Simplest Form of Closed Loop System</i>	24
2.2 The Concept of Stability	26

2.3	Response Testing of Control Systems	28
2.4	The Integration Process	32
2.5	Hydraulic Servo-actuator Example	37
2.6	Calculating Frequency Response	40
2.6.1	<i>Frequency Response of a First-order Lag</i>	43
2.6.2	<i>Frequency Response of a Second-order System</i>	45
2.7	Aircraft Flight Control System Example	47
2.7.1	<i>Control System Assumptions</i>	48
2.7.2	<i>Open Loop Analysis</i>	49
2.7.3	<i>Closed Loop Performance</i>	53
2.8	Alternative Graphical Methods for Response Analysis	54
2.8.1	<i>The Nyquist Diagram</i>	54
2.8.2	<i>Deriving Closed Loop Response from Nyquist Diagrams</i>	59
2.8.3	<i>The Nichols Chart</i>	62
2.8.4	<i>Graphical Methods – Summary Comments and Suggestions</i>	66
2.9	Chapter Summary	68
3	Control System Compensation Techniques	71
3.1	Control System Requirements	71
3.2	Compensation Methods	72
3.2.1	<i>Proportional Plus Integral Control</i>	73
3.2.2	<i>Proportional Plus Integral Plus Derivative Control</i>	76
3.2.3	<i>Lead–Lag Compensation</i>	78
3.2.4	<i>Lag–Lead Compensation</i>	81
3.2.5	<i>Feedback Compensation</i>	84
3.3	Applications of Control Compensation	89
3.3.1	<i>Proportional Plus Integral Example</i>	89
3.3.2	<i>Lead–Lag Compensation Example</i>	97
3.3.3	<i>Class 2 System Design Example</i>	101
3.4	Chapter Summary	114
4	Introduction to Laplace Transforms	117
4.1	An Overview of the Application of Laplace Transforms	117
4.2	The Evolution of the Laplace Transform	118
4.2.1	<i>Proof of the General Case</i>	121
4.3	Applying Laplace Transforms to Linear Systems Analysis	124
4.3.1	<i>Partial Fractions</i>	129

4.4	Laplace Transforms – Summary of Key Points	138
4.5	Root Locus	140
4.5.1	<i>Root Locus Construction Rules</i>	141
4.5.2	<i>Connecting Root Locus to Conventional Linear Analysis</i>	146
4.6	Root Locus Example	152
4.7	Chapter Summary	155
5	Dealing with Nonlinearities	157
5.1	Definition of Nonlinearity Types	157
5.2	Continuous Nonlinearities	159
5.2.1	<i>Engine Fuel Control System Example</i>	161
5.3	Discontinuous Nonlinearities	167
5.3.1	<i>Stability Analysis with Discontinuous Nonlinearities</i>	172
5.4	The Transport Delay	176
5.5	Simulation	179
5.6	Chapter Summary	188
6	Electronic Controls	191
6.1	Analog Electronic Controls	193
6.1.1	<i>The Operational Amplifier</i>	194
6.1.2	<i>Building Analog Control Algorithms</i>	195
6.2	The Digital Computer as a Dynamic Control Element	197
6.2.1	<i>Signal Conversion</i>	197
6.2.2	<i>Digital Controller Architectures</i>	201
6.3	The Stability Impact of Digital Controls	206
6.4	Digital Control Design Example	210
6.5	Creating Digital Control Algorithms	215
6.5.1	<i>The Integrator</i>	215
6.5.2	<i>The First-order Lag</i>	216
6.5.3	<i>The Pseudo Derivative</i>	217
6.6	Chapter Summary	218
7	Concluding Commentary	221
7.1	An Overview of the Material	222
7.2	Graphical Tools	225
7.3	Compensation Techniques	227
7.3.1	<i>Integral Wind-up</i>	227
7.3.2	<i>Avoid Using Pure Derivative Action</i>	228
7.3.3	<i>Mechanical Stiffness Estimates are Always High</i>	228

7.4	Laplace Transforms and Root Locus Techniques	229
7.5	Nonlinearities	230
7.6	Digital Electronic Control	232
7.7	The Way Forward	233
Index		235
