

Earth System History

Third Edition

Steven M.
Stanley

PREFACE xvi

PART I MATERIALS, PROCESSES, AND PRINCIPLES

CHAPTER 1 EARTH AS A SYSTEM 1

Exploring the Earth System 2

Earth is special 2

The components of the system are interrelated 2

The system is fragile 3

The Principle of Actualism 3

Catastrophism versus actualism in the nineteenth century 4

The Nature and Origin of Rocks 5

Igneous, sedimentary, and metamorphic rocks can form from one another 5

Bodies of rock are classified into formal units 8

Steno's three principles concern sedimentary rocks 8

The rock cycle relates all kinds of rocks to one another 9

Global Dating of the Rock Record 10

Fossils and physical markers indicate relative ages of rocks 10

Radioactive decay provides actual ages of rocks 10

The geologic time scale divides Earth's history into formal units 11

Intervals of the geologic time scale are distinctive 12

Imaging Earth Below 12

Earth's density increases with depth 13

Solid plates of lithosphere move over the slushlike asthenosphere 14

Plate Tectonics 14

Plates spread apart where they form, slide past one another, and eventually sink 14

Heat from radioactive decay fires the engine of plate tectonics 16

Plumes of magma rise into the crust from deep within the mantle 17

Plate tectonics plays a role in the rock cycle 17

The Water Cycle 18

Water moves between reservoirs 18

The water cycle and the rock cycle are inseparable 19

Directional Change in Earth's History 19

Evolution reshapes life drastically and irreversibly 19

Physical and chemical features of Earth have also changed 20

Life and environments have changed in concert 20

Episodic Change in Earth's History 20

Sedimentation occurs in pulses 21

Deposition can be catastrophic 21

Unconformities represent large breaks in the rock record 22

Life on Earth has experienced pulses of change 22

Chapter Summary/Review Questions 22

CHAPTER 2 ROCK-FORMING MINERALS AND ROCKS 25

Visual Overview: Rocks and Their Origins 26

The Structure of Minerals 28

An element consists of a unique kind of atom 28

Isotopes of an element have distinctive atomic weights 28

Chemical reactions produce minerals 29

Chemical reactions create chemical bonds 29

Crystals have three-dimensional molecular structures 31

Ions of an element can substitute for ions of another element 31

The Properties of Minerals 32

Chemical bonds determine hardness 32

The weight and packing of atoms determine density 33

Fracture patterns reflect crystal structure 33

Minerals and rocks form under particular physicochemical conditions 33

A few families of minerals form most rocks 33

Types of Rocks 35

- Igneous rocks form when molten rock cools 35
- Sedimentary rocks form from particles that settle through water or air 37
- Metamorphic rocks form from other rocks at high temperatures and pressures 44
- Chapter Summary/Review Questions 46

CHAPTER 3 THE DIVERSITY OF LIFE 47

Visual Overview: The Six Kingdoms 48

Fossils and Chemical Remains of Ancient Life 50

- Hard parts are the most commonly preserved features of animals 50
- Soft parts of animals are rarely preserved 50
- Permineralization produces petrified wood 51
- Molds and impressions are imprints 51
- Trace fossils are records of movement 52
- The quality of the fossil record is highly variable 52
- Biomarkers are useful indicators of life 53
- Dead organisms decay to form fossil fuels 53

Taxonomic Groups 53

Identifying Clades and Their Relationships 55

Archaea and Bacteria: The Two Domains of Prokaryotes 59

- Archaea tolerate hostile environments 59
- Bacteria include decomposers, causes of disease, and pollutants 59

The Protists: A Kingdom Consisting Mainly of Single-Celled Organisms 60

The Fungi: A Kingdom of Decomposers 62

Plants: Multicellular Photosynthesizers with Tissues 62

- Seedless vascular plants came first 63
- Seed plants invaded dry land 64

Animals 65

- Sponges: a phylum of simple invertebrates 65
- Cnidarians: a phylum that includes the corals 65
- Lophotrochozoans include most kinds of animals that lack skeletons 66
- Ecdysozoans 68
- Deuterostomes include starfishes and their relatives as well as vertebrates 68
- Chapter Summary/Review Questions 73

CHAPTER 4 ENVIRONMENTS AND LIFE 75

Visual Overview: The Distribution of Environments and Life on Earth 76

Principles of Ecology 78

- A species' niche is its position in the environment 78
- A community of organisms and its environment form an ecosystem 79
- Biogeography concerns broad patterns of occurrence 80

The Atmosphere 81

- Nitrogen, oxygen, and carbon dioxide constitute most of the atmosphere 81
- Temperature variations and Earth's rotation govern circulation in the atmosphere 82

The Terrestrial Realm 84

- Vegetation patterns parallel climatic zones* 84
- Climates change with elevation 87
- Land and water influence seasonal temperature change 88
- Fossil plants reflect ancient climatic conditions 89

The Marine Realm 90

- Winds drive ocean currents 91
- Marine life varies with water depth 92
- Marine life floats, swims, or occupies the seafloor 93
- Water temperature influences biogeographic patterns 95
- Salinity is an important limiting factor near shore 96

Freshwater Environments 97

Chapter Summary/Review Questions 97

CHAPTER 5 SEDIMENTARY ENVIRONMENTS 99

Visual Overview: Depositional Environments and Accumulation of Sediments 100

Nonmarine Environments 102

- Ancient soils can point to past climatic conditions 102
- Freshwater lakes and glaciers leave clues to ancient climates 103
- Deserts and arid basins accumulate salt and sand 106

Braided and meandering rivers deposit sediment in moist regions	108
Marginal Marine and Open-Shelf Environments	111
A delta forms where a river meets the sea	111
Lagoons lie behind barrier islands of sand	113
Open-shelf deposits include tempestites	114
Fossils serve as indicators of marine environments	114
Organic reefs are bodies of carbonate rock	116
Carbonate platforms form in warm seas	118
Deep-Sea Environments	120
Turbidites flow down submarine slopes	120
Pelagic sediments are fine-grained and accumulate slowly	122
Chapter Summary/Review Questions	123

CHAPTER 6 CORRELATION AND DATING OF THE ROCK RECORD 125

Visual Overview: Methods of Stratigraphic Correlation	126
The Geologic Time Scale	128
Fossil succession reveals the relative ages of rocks	128
Geologic systems were founded in the nineteenth century	128
Stratigraphic Units	130
The rock record is divided into time-rock units and geologic time into time units	130
Biostratigraphic units are based on fossil occurrences	130
Magnetic stratigraphy identifies polarity time-rock units	132
Rock units are defined by lithology, not age	132
Earth's Absolute Age	136
Early geologists underestimated Earth's antiquity	136
Radioactive decay provides absolute ages of rocks	137
Fossils often provide more accurate correlation than isotopic dating	140
Changes in stable isotopes permit global correlation	141
Event Stratigraphy	142
Marker beds allow correlation over wide areas	143

Back-and-forth shifting of facies boundaries creates marker beds	144
Unconformities can be detected by seismic stratigraphy	145
Sequences record changes in sea level	146
Changes in Earth's rotation create geologic clocks	147
Chapter Summary/Review Questions	149

CHAPTER 7 EVOLUTION AND THE FOSSIL RECORD 151

Visual Overview: The Evolution of Life	152
Adaptations	154
Charles Darwin's Contribution	155
The voyage of the <i>Beagle</i> provided geographic evidence	155
Darwin's anatomical evidence was broadly based	157
Natural selection is the mechanism of evolution	157
Genes, DNA, and Chromosomes	158
Regulatory Genes and Patterns of Development	159
Populations, Species, and Speciation	159
Horizontal Gene Transfer	160
Rates of Origination	161
The Molecular Clock and Times of Origination	163
Evolutionary Convergence	164
Extinction	164
Rates of extinction vary greatly	165
A mass extinction is occurring today	166
Evolutionary Trends	167
Animals tend to evolve toward larger body size	167
Evolutionary trends can be simple or complex	169
Evolution is irreversible	172
Chapter Summary/Review Questions	173

CHAPTER 8 THE THEORY OF PLATE TECTONICS 175

Visual Overview: Elements of Plate Tectonics	176
The History of Continental Drift Theory	178

Some early observations were <i>misinterpreted</i>	178
Alfred Wegener was a twentieth-century pioneer	180
Alexander Du Toit focused on the Gondwana sequence	180
Continental drift was widely rejected	182
Paleomagnetism showed puzzling patterns	183
The Rise of Plate Tectonics	184
Seafloor spreading explained many phenomena	184
Paleomagnetism provided a definitive test	187
Faulting and Volcanism along Plate Boundaries	187
Oceanic crust forms along mid-ocean ridges	188
<i>Transform faults offset mid-ocean ridges</i>	189
Lithosphere is subducted along deep-sea trenches	189
Plate Movements	190
Plates move for four reasons	190
Free slabs sink deep into the mantle	191
Plate movements are measurable	191
Chapter Summary/Chapter Review	193

CHAPTER 9 CONTINENTAL TECTONICS AND MOUNTAIN CHAINS 195

Visual Overview: Formation and Deformation of Continental Margins	196
The Rifting of Continents	198
Hot spots give rise to three-armed rifts	198
Rift valleys form when continental breakup begins	200
Rifting creates passive margins	200
Bending and Flowing of Rocks	202
Mountain Building	204
Continental collision produces orogenies	204
Orogenies can occur without continental collision	205
Mountain belts have a characteristic structure	205
Compressive forces cause deformation	206
The weight of a mountain belt creates a foreland basin	206
The Andes exemplify mountain building without continental collision	208

The Pyrenees exemplify mountain building by <i>continental collision</i>	209
Suturing of Small Landmasses to Continents	211
Tectonics of Continental Interiors	211
Chapter Summary/Review Questions	213

CHAPTER 10 MAJOR CHEMICAL CYCLES 215

Visual Overview: Key Chemical Cycles in Earth System History	216
Chemical Reservoirs	218
Fluxes are rates of movement between reservoirs	218
Feedbacks affect fluxes	218
Carbon Dioxide, Oxygen, and Biological Processes	219
Plants employ a photosynthesis-respiration cycle	219
Photosynthesis produces tissue growth	220
Respiration releases energy	220
Decomposers employ respiration	220
Burial of plant debris alters atmospheric chemistry	221
Marine cycles resemble terrestrial cycles	223
Use of Carbon Isotopes to Study Global Chemical Cycles	223
Carbon isotopes record the cycling of organic carbon	224
Isotope ratios in limestones and deep-sea sediments record changes in rates of carbon burial	224
Carbon and sulfur burial enlarges the atmosphere's oxygen reservoir	226
Carbon dioxide is removed from the atmosphere by weathering and ends up in limestone	226
Changes in rates of weathering affect the atmospheric carbon reservoir	226
Phanerozoic Trends in Atmospheric CO ₂	228
Feedbacks in the Carbon Cycle	229
Release of frozen methane provides positive feedback	230
Negative feedbacks hold CO ₂ levels in check	230
Oxygen Isotopes, Climate, and the Water Cycle	232
Oxygen isotope ratios in skeletons reflect temperatures	232

Oxygen isotope ratios vary with salinity	232
Glaciers lock up oxygen	233
Water vapor as a greenhouse gas	234
Ocean Chemistry and Skeletal Mineralogy	235
Magnesium and calcium vary over time	235
Silica	237
Chapter Summary/Review Questions	237

PART II THE STORY OF EARTH

CHAPTER 11 THE HADEAN AND ARCHEAN EONS OF PRECAMBRIAN TIME 239

Visual Overview: Major Events of the Hadean and Archean Eons	242
The Ages of the Planets and the Universe	244
The Origin of the Solar System	245
The sun formed from a nebula	246
The planets formed from a rotating dust cloud	246
The Hadean Eon	247
Early melting produced a layered Earth	248
The moon formed from a collision	248
The ocean's water came from volcanoes and comets, and its salts came from rocks	249
Earth's early atmosphere mostly came from within	249
Early Earth experienced many meteorite impacts	249
Early Earth was hot, and its plates were small	250
The Origin of Continental Crust	250
Felsic crust formed by melting of oceanic lithosphere	250
Continental crust appeared early in Earth's history	251
The Archean Eon	251
Archean continents remained small because of Earth's hot interior	251
The total amount of continental crust increased rapidly	252
Greenstone Belts	252
Earth System Shift 11-1 Large Cratons Appear Near the End of Archean Time	254
Evidence of Archean Life	256

Life appeared on Earth after 4.5 billion years ago	256
Chemical Evidence Bearing on the Origin of Life	258
Amino acids formed easily	258
Perhaps there was an RNA world	258
Life may have originated along mid-ocean ridges	259
Atmospheric Oxygen	261
Chapter Summary/Review Questions	261

CHAPTER 12 THE PROTEROZOIC EON OF PRECAMBRIAN TIME 263

Visual Overview: Major Events of the Proterozoic and Mesoproterozoic	264
A Modern Style of Orogeny	266
Global Events of the Paleoproterozoic and Mesoproterozoic	268
Glaciation was widespread early in Proterozoic time	269
Cyanobacteria flourished in the oceans, and eukaryotes joined them	269
The Beginnings of Animal Life	271
Animals burst on the scene	271
Worldwide glaciation during Proterozoic time	275
A buildup of atmospheric oxygen favored eukaryotes	275
Earth System Shift 12-1 Was There a Snowball Earth?	276
Earth System Shift 12-2 Buildup of Atmospheric Oxygen	278
Perhaps the diversification of animals caused a major change in the evolution of phytoplankton	280
The Expansion and Contraction of Continents	280
The Assembly of North America	281
Continental accretion expanded Laurentia during Proterozoic time	281
A rift formed in central and eastern North America	282
The Grenville Orogeny built mountains in eastern North America	284

The Assembly and Breakup of Neoproterozoic
Supercontinents 284

The supercontinent Rodinia was
assembled 284

Rodinia split apart to form the Pacific
Ocean 285

Did another Neoproterozoic supercontinent
form near the end of the Proterozoic? 285

The Paleozoic continents were born 285

Chapter Summary/Review Questions 286

CHAPTER 13 THE EARLY PALEOZOIC WORLD 287

Visual Overview: Major Events of the Early
Paleozoic 288

The Cambrian Explosion of Life 290

The base of the Cambrian is defined by burrows
of complex form 290

Many Early Cambrian groups evolved
skeletons 290

Earth System Shift 13-1 Skeletons Evolve in
Many Animal Groups 292

Early Cambrian animals had few modes of
life 294

Later Cambrian diversification produced
vertebrate animals 296

Ordovician Life 298

Among Early Ordovician animals were floaters
and swimmers 298

A great radiation of life occurred later in the
Ordovician 299

Animals caused stromatolites to decline 300

Extinction set back marine diversification 300

Did plants invade the land? 301

Paleogeography of the Cambrian World 301

Episodic Mass Extinctions of Trilobites 303

Ordovician Paleogeography 304

Glaciation and sea-level lowering occurred at the
end of the Ordovician 304

Late Ordovician climatic change caused a two-
step mass extinction 304

Regional Events of Early Paleozoic Time 305

The Taconic orogeny raised mountains in eastern
Laurentia 305

Earth System Shift 13-2 Glaciation Results
in Mass Extinction 308

A passive margin persisted in western
Laurentia 312

Chapter Summary/Review Questions 312

CHAPTER 14 THE MIDDLE PALEOZOIC WORLD 315

Visual Overview: Major Events of the Middle
Paleozoic 316

Renewed Diversification of Life 318

Life recovered and expanded in aquatic
habitats 318

Plants invaded the land 325

Animals moved ashore 327

Earth System Shift 14-1 Plants Alter
Landscapes and Open the Way for
Vertebrates to Conquer the Land 328

The Paleogeography of the Middle Paleozoic
World 331

Glaciation and a Great Mass Extinction 332

Regional Events of Middle Paleozoic Time 332

Eastern North America again became a passive
margin 332

Euramerica formed during the second
Appalachian orogeny 333

Earth System Shift 14-2 The Expansion of
Plants over the Land Causes Global Climatic
Change, Glaciation, and Mass Extinction 334

Chapter Summary/Review Questions 339

CHAPTER 15 THE LATE PALEOZOIC WORLD 341

Visual Overview: Major Events of the Late
Paleozoic 342

Late Paleozoic Life 344

New forms of life emerged in Paleozoic seas 345

Aragonitic reef builders flourished in aragonite
seas 346

Trees grew in swamps 346

Upland floras expanded 348

Animals diversified on land and invaded
freshwater habitats 351

Earth System Shift 15-1 Weakened Greenhouse
Warming Results in a Great Ice Age 352

Paleogeography of the Late Paleozoic World 356

Warm, moist conditions were widespread in
Early Carboniferous time 356
In mid-Carboniferous time, continents collided
and a great ice age began 356
Dry habitats expanded in Permian time 356
Mass extinctions ended the Paleozoic Era 358

**Earth System Shift 15-2 The Most Destructive
of All Mass Extinctions Ends the Paleozoic Era 359**

Regional Events of Late Paleozoic Time 362
The Alleghenian orogeny formed the
Appalachian Mountains 362
Orogenies also occurred in the southwestern
United States 364
Coal deposits formed within cyclothems 365
Reefs formed in the Delaware Basin of western
Texas 367
The Sonoma orogeny expanded the North
American continent 370
Chapter Summary/Review Questions 371

**CHAPTER 16 THE EARLY MESOZOIC
ERA 373**

Visual Overview: Major Events of the Early
Mesozoic 374

Life in the Oceans: A New Biota 376
Benthic life recovered after the Permian
crisis 377
Pelagic life included new groups of
phytoplankton and numerous swimming
predators 378

Life on Land 380
Gymnosperms dominated the Mesozoic
flora 380
The Age of Dinosaurs began 382

**Earth System Shift 16-1 The Rise of the
Dinosaurs: Why Were They So Successful? 386**

The Paleogeography of the Early Mesozoic
Era 390
The size of Pangaea affected climates and
distributions of organisms 391
Pangaea began to fragment 392
Tropical and nontropical zones were evident,
even in Europe 393

Mass Extinctions 393

**Earth System Shift 16-2 Volcanism and Mass
Extinction 394**

Tectonic Events in North America 394
Fault block basins formed in the east 395
North America grew westward 397
Chapter Summary/Review Questions 401

**CHAPTER 17 THE CRETACEOUS
WORLD 403**

Visual Overview: Major Events of the
Cretaceous 404

Cretaceous Life 406
Pelagic life was modernized 406
Benthic life was also modernized 408
Modern marine predators proliferated 409
Flowering plants expanded on land 410
Dinosaurs dwarfed early mammals 411

Paleogeography of the Cretaceous World 414
Continents fragmented and narrow oceans
expanded 414
Sea level rose, the deep ocean stagnated, and
climates warmed 416

The Terminal Cretaceous Extinction 418
The terminal Cretaceous impact issued a
warning 419
Fossils disguised the timing of the
extinction 419
Opportunistic species flourished in the aftermath
of the extinction 419

**Earth System Shift 17-1 Death from Outer
Space 420**

North America in the Cretaceous World 423
Cordilleran mountain building continued 423
A seaway connected the Gulf of Mexico and
Arctic Ocean 424
The modern continental shelf formed in eastern
North America 425

The Chalk Seas of Europe 427
Chapter Summary/Review Questions 427

**CHAPTER 18 THE PALEOGENE
WORLD 429**

Visual Overview: Major Events of the
Paleogene 430

Life of the Paleogene 432
Marine life recovered 432
Flowering plants rose to dominance 434

Mammals radiated dramatically in the Paleocene and Eocene 434
Early Paleogene birds were large 437
Modern groups of hoofed animals, carnivores, and primates expanded in the Oligocene 438
Frogs and insects were modernized in Paleogene time 439

Paleogene Climates 440

The Eocene began with a pulse of warming 440
Warmth extended to high latitudes 441
Climatic change, glaciation, and a mass extinction marked the Eocene-Oligocene transition 443

Regional Events of Paleogene Time 443

Positions of land and sea changed near the poles 443
Mountain building continued in western North America 443

Earth System Shift 18-1 Global Cooling and Drying Begins 444

A rift developed in the American Southwest 448
Shallow subduction produced volcanism in the Yellowstone region 448
Deposition continued along the Gulf Coast 449
A meteorite created the site of the Chesapeake Bay 450

Chapter Summary/Review Questions 452

CHAPTER 19 THE NEOGENE WORLD 453

Visual Overview: Major Events of the Neogene 454

Worldwide Events of the Neogene Period 456

In the ocean, whales radiated and foraminifera recovered 456
On land, species adapted to seasonally dry habitats flourished 457

The Modern Ice Age of the Northern Hemisphere 461

Early Pliocene climates were relatively warm 461
Continental glaciers formed in the Northern Hemisphere 461
The chronology of glaciation can be read in isotope ratios 463
Climatic changes altered floras 465

Glaciers expanded and contracted many times 465

Vegetation patterns changed during glacial maxima 466

Changes in oceanic circulation may have triggered the Ice Age 467

Earth System Shift 19-1 Shockingly Rapid Climatic Shifts Occur during the Ice Age 468

Changes in Earth's rotational movement may have affected glacial cycles 470

Regional Events of Neogene Time 470

Mountains rose up throughout the American West 471
The Appalachians bobbed up and shed sediment eastward 478
The Caribbean Sea was born 479
North and South America exchanged mammals 480
The Himalaya rose to become Earth's highest mountain range 480
The Tethys Seaway came to an end 482

Human Evolution 484

Early apes radiated in Africa and Asia 484
The earliest hominid lived about 6 million years ago 484
The australopithecines resembled both apes and humans 485
The human genus made a sudden appearance 486
Homo erectus resembled us 488
Homo heidelbergensis resembled us even more 489
The Neanderthals emerged in Eurasia 489

Earth System Shift 19-2 The Human Genus Arises at a Time of Sudden Climatic Change 490

Homo sapiens evolved in Africa and spread north 492

Chapter Summary/Review Questions 493

CHAPTER 20 THE HOLOCENE 495

Visual Overview: Major Events of the Holocene 496

The Retreat of Glaciers 499

Abrupt Global Events of the Early Holocene 500

The Younger Dryas 501

The First Americans 502

A Sudden Extinction of Large Mammals 503

Earth System Shift 20-1 Evidence That a Comet Struck Earth, Causing the Younger Dryas Event, the Extinction of Large Mammals, and the Disappearance of the Clovis Culture 504

Climatic Fluctuations of the Last 10,000

Years 507

The hypsithermal interval was a brief period of global warmth 508

Humans invented agriculture 508

Glaciers, tree lines, and tree rings record climatic change 509

Temperatures have fluctuated since the hypsithermal interval 509

Severe droughts have occurred during Holocene time 511

Sea Level 512

Sea level rose rapidly in the early Holocene 512

Coastlines have shifted during the past 7000 years 513

The Twentieth and Twenty-First Centuries: The Impact of Humans 514

Human activities cause greenhouse warming 514

Tundra can release methane, a powerful greenhouse gas 515

Future climatic change will have serious consequences 515

Increased CO₂ will affect plants 517

Sea level will rise 517

The power of positive feedbacks 518

Chapter Summary/Review Questions 519

APPENDIX: STRATIGRAPHIC STAGES 521

GLOSSARY 525

INDEX 535
