Computational Optimal Control

Tools and Practice

 WILEY

Contents

Preface	ix
Acknowledgements	xv
Nomenclature	xvii
1 Introduction	1
1.1 Historical Context of Computational Optimal Control	2
1.2 Problem Formulation	4
1.3 Outline of the Book	6
2 Optimal Control: Outline of the Theory and Computation	9
2.1 Optimisation: From Finite to Infinite Dimension	9
2.1.1 Finite Dimension: Single Variable	10
2.1.2 Finite Dimension: Two or More Variables	15
2.1.3 Infinite Dimension	24
2.2 The Optimal Control Problem	27
2.3 Variational Approach to Problem Solution	29
2.3.1 Control Constraints	32
2.3.2 Mixed State–Control Inequality Constraints	33
2.3.3 State Inequality Constraints	33
2.4 Nonlinear Programming Approach to Solution	34
2.5 Numerical Solution of the Optimal Control Problem	36
2.5.1 Direct Method Approach	36
2.5.2 Indirect Method Approach	43
2.6 Summary and Discussion	47
3 Minimum Altitude Formulation	49
3.1 Minimum Altitude Problem	49
3.2 Qualitative Analysis	50
3.2.1 First Arc (Level Flight): Minimum Altitude Flight $t_0 \leq t \leq t_1$	50
3.2.2 Second Arc: Climbing	63
3.2.3 Third Arc: Diving ($t_3 \leq t \leq t_f$)	64
3.3 Mathematical Analysis	64
3.3.1 The Problem with the Thrust Constraint Only	64

3.3.2	Optimal Control with Path Constraints	66
3.3.3	First Arc: Minimum Altitude Flight	67
3.3.4	Second Arc: Climbing	69
3.3.5	Third Arc: Diving	70
3.4	Indirect Method Solution	71
3.4.1	Co-state Approximation	71
3.4.2	Switching and Jump Conditions	74
3.4.3	Numerical Solution	79
3.5	Summary and Discussion	80
3.5.1	Comments on Switching Structure	85
4	Minimum Time Formulation	95
4.1	Minimum Time Problem	96
4.2	Qualitative Analysis	96
4.2.1	First Arc (Level Flight): Minimum Altitude Flight	96
4.2.2	Second Arc (Climbing)	100
4.2.3	Third Arc (Diving)	100
4.3	Mathematical Analysis	101
4.3.1	The Problem with the Thrust Constraint Only	101
4.3.2	Optimal Control with Path Constraints	103
4.3.3	First Arc: Minimum Altitude Flight	104
4.3.4	Second Arc: Climbing	105
4.3.5	Third Arc: Diving	106
4.4	Indirect Method Solutions	107
4.5	Summary and Discussion	113
4.5.1	Comments on Switching Structure	113
5	Software Implementation	119
5.1	DIRCOL implementation	123
5.1.1	User.f	123
5.1.2	Input File DATLIM	128
5.1.3	Input File DATDIM	129
5.1.4	Grid Refinement and Maximum Dimensions in DIRCOL	132
5.2	NUDOCCCS Implementation	132
5.2.1	Main Program	133
5.2.2	Subroutine MINFKT	136
5.2.3	Subroutine INTEGRAL	136
5.2.4	Subroutine DGLSYS	136
5.2.5	Subroutine ANFANGSW	137
5.2.6	Subroutine RANDBED	138
5.2.7	Subroutine NEBENBED	138
5.2.8	Subroutine CONBOXES	139
5.3	GESOP (PROMIS/SOCS) Implementation	139
5.3.1	Dynamic Equations, Subroutine fmrhs.f	141
5.3.2	Boundary Conditions, Subroutine fmbcon.f	143
5.3.3	Constraints, Subroutine fmpcon.f	144

5.3.4	Objective Function, Subroutine <code>fmpcst.f</code>	145
5.4	BNDSCO Implementation	146
5.4.1	Possible Sources of Error	146
5.4.2	BNDSCO Code	148
5.5	User Experience	154
6	Conclusions and Recommendations	159
6.1	Three-stage Manual Hybrid Approach	159
6.2	Generating an Initial Guess: Homotopy	160
6.3	Pure State Constraint and Multi-objective Formulation	161
6.4	Final Remarks	162
Appendix	BNDSCO Benchmark Example	165
A.1	Analytic Solution	165
A.1.1	Unconstrained or Free Arc ($l \geq 1/4$)	167
A.1.2	Touch Point Case ($1/6 \leq l \leq 1/4$)	168
A.1.3	Constrained Arc Case ($0 \leq l \leq 1/6$)	169
