Preface xi
Introduction xiii
Author xv
Symbols and Abbreviations (General) xvii

Chapter 1 Concepts and Definitions 1

Theoretical Outline 1
Stiffness and Natural Frequency 1
The Analogy between Translational and Rotational Motion 3
Units 3
Inertia Force and Dynamic Equilibrium 5
Equivalent Stress and a Safety Factor 5

Chapter 2 Natural Frequency 7

Theoretical Outline 7
Determination of Natural Frequency by the Direct Method and by the Energy Method 7
Bodies with Continuous Mass Distribution 8
Equations of Motion: Bar and Shaft 8
Equations of Motion: Cable and Shear Beam 11
Equations of Motion: Flexural Beam 13
Beams on Elastic Foundation 14
Continuous Elastic Medium 14
Types of Structural Arrangements 14
A Two-Mass Oscillator 15
Geometric Stiffening 16
Buckling Force, Critical Force, Stiffness, and Frequency 18
Static Deflection Method, Dunkerley's Method, and Addition of Flexiblilities 19
Distributed Mass System with a Single Lumped Mass 20
Symmetry Properties 21
Closing Remarks 23
Tabulation of Cases 24
Comments 24
Cases (2.1–2.49) 24
Examples (2.1–2.6) 42

Chapter 3 Simple Linear Systems 49

Theoretical Outline 49
Equations of Motion 49
Free, Undamped Motion 50
Forced, Undamped Motion 51
Free, Damped Motion 52
Forced, Damped Motion 54
Response of Oscillator to Step Loading 55
Response of Oscillator to Impulsive Load 57
Oscillator Response to Triangular Pulses 58
Summary of Response to Single Pulses 60
Multiple Shock Loads 60
Shock Isolation 62
Types of Damping 64
Tabulation of Cases 67
Cases (3.1–3.39) 67
Examples (3.1–3.9) 87

Chapter 4 Simple Nonlinear Systems 95

Theoretical Outline 95
General Remarks about Nonlinearities 95
Elastic, Nonlinear Systems 96
Material Nonlinearity, Ductile Materials 98
Shear and Twisting of Shafts 101
Properties of Concrete 102
Stress and Strain in a Large Deformation Range 104
Some Response Features 106
Duration of Forward Motion with the Initial Velocity Prescribed 107
Characteristics of a Polytropic Gas 109
Large Deflections of Simple Elements 110
Thick Rings and Shells of EPP Material 113
A Body of a Variable Mass 116
Tabulation of Cases 117
Cases (4.1–4.30) 117
Examples (4.1–4.11) 136

Chapter 5 Wave Propagation 147

Theoretical Outline 147
The Basic Solution of the Equation of Motion 147
Imposition of End Disturbance 150
Traveling Waves, Vibration, and a Standing Wave Concept 152
Unconstrained Bar Pushed at the End 154
Collision of Waves 155
Transmission of Waves between Materials of Different Properties 156

Waves in Bars of Nonlinear Material 158
The Extent of a Plastic Wave Spreading 159
Bar Impacting Rigid Wall, Inelastic Range 162
Constrained Bar Pushed at the End 163
Twisting Deformation of Shafts 165
Strong Shock Waves 166
Body Waves in an Unbounded Elastic Medium 168
Waves in an Elastic Half-Space 170
Nonreflecting Boundary 172
Pulse Decay due to Material Damping 173
Some Notes on Finite-Element Modeling of Wave Motion 175
Comments on Limits of Some Solutions 176
Closing Remarks 177
Tabulation of Cases 178
Cases (5.1–5.20) 178
Examples (5.1–5.22) 193

Chapter 6 Yield and Failure Criteria 215

Theoretical Outline 215
Basic Theories of Combined Stress 215
Failure under Applied Load 218
Strain-Rate Effects on Smooth Material Samples 218
Balanced Material Concept 220
Strength of Notched Elements under Dynamic Loading 221
Strain Rate in Concrete 224
Closing Remarks 225
Examples (6.1–6.2) 226

Chapter 7 Impact 229

Theoretical Outline 229
Central Impact against Rigid Wall 229
Particle Impact against Rigid Surface 231
Body Impact against Frictionless Surface 231
Body Impact against No-Slip Surface 233
Body of Revolution Impacting a Surface 235
Peak Impact Force and Duration of Impact 236
Local Deformation Formulas for Elastic Contact 237
Parameters of Impact according to Hertz Theory 239
Elastoplastic Contact and Perfectly Plastic Contact 241
Rigid Mass Impacting an Axial Bar 244
Axial Bar with the End Spring 246
Closing Remarks 247
Tabulation of Cases 248
Comments 248
Cases (7.1–7.33) 248
Examples (7.1–7.18) 265

Chapter 8 Collision 279

Theoretical Outline 279
Central Collision of Bodies 279
Collision of Particles in a Plane 281
Collision of Two Bodies and the Influence of Friction 282
Impact against Body Free to Rotate about Fixed Axis 284
Parameters of Collision with Linear Characteristic 285
Parameters of Collision with Nonlinear Characteristic 286
Shock Load on Unconstrained Bodies and Dynamic Equilibrium Concept 287
Axial Collision of Two Bars with Identical Properties 288
Axial Collision of Two Bars with Different Properties 290
Collision Method for a Mass–Beam Impact Problem 291
Collision Accompanied by Strong Shock Waves 292
Tabulation of Cases 294
Comments 294
Cases (8.1–8.18) 294
Examples (8.1–8.8) 306

Chapter 9 Cables and Strings 315

Theoretical Outline 315
Statics of Cables 315
Strain Energy and Work 317
Transient Cable Motion 319
Inelastic Cable 322
Projectile Impact 323
End Disturbance in Cable Motion 325
Closing Remarks 326
Tabulation of Cases 327
Cases (9.1–9.14) 327
Examples (9.1–9.9) 338

Chapter 10 Beams 347

Theoretical Outline 347
Basic Relationships 347
Pure Bending 347
Static and Dynamic Properties of Elastic Beams 351
Distributed Loading, Elastic Range 353
Estimation of Response to Rectangular Load Pulses 353
Alternative Estimates of Peak Responses 354
Responses to Other Impulse Shapes 356
The Accuracy of the SDOF Approach 356
Point Loads, Elastic Range 357
Transient Beam Response due to a Suddenly Applied Point Load 357

Global Response of an Elastic Beam to a Point–Load Impact 359
The Influence of Shear Deformation and Sustained Axial Force 360
Mass–Beam Impact 361
The Lumped-Parameter Methods for Mass–Beam Impact Problem 361
Application of a Shear Beam Concept 362
A Mass–Beam Impact Approach Involving Transient Beam Deformation 363
Elastic Strain Energy and Approximate Deflected Shapes 366
Distributed Loading, Inelastic Range 367
Assumptions and Procedures 367
Limit Values of Bending Moment and Shear Force 368
Static Collapse Values for Distributed Load 369
Simplified Estimates of Dynamic Response 371
The Influence of Material Model and the Assumed Shape 374
Point Loads, Inelastic Range 375
Basic Response to Point Loads 375
Infinite or Semi-Infinite Beams, Stationary Joints, and Traveling Joints 376
Finite-Length Unconstrained Beams, Step Load, Stationary Joints 379
Some Cases of Strain Distribution along a Beam 380
Deformation History When Plastic Joints Are Involved 382
Special Topics 383
High-Speed Collision of Two Beams 383
Beams on Elastic Foundation 385
Sandwich Beams 386
Laminated Beams 387
Dynamic Strength of a Circular Ring in Radial Motion 389
Closing Remarks 390
Tabulation of Cases 391
Cases (10.1–10.38) 391
Examples(10.1–10.22) 415

Chapter 11 Columns and Beam–Columns 437

Theoretical Outline 437
Axially Compressed Beams 437
Strain Energy in an Elastic Column 439
Buckling When Peak Stress Exceeds the Yield Point 440
Two-Flange Symmetrical Column 441
Section Capacity under Combined Load Components 444
Compression of Imperfect Columns, Yield Strength, and Post-Yield Response 445
Dynamic Buckling of Elastic Members 448
Higher-Order Elastic Buckling of Imperfect Columns 449
Reinforced Concrete (RC) Column 451
Rigid Stick Models of Axially Impacted Beams 455

Beams with No Translation of End Points 458
Closing Remarks 462
Tabulation of Cases 463
Comments 463
Cases (11.1–11.29) 463
Examples (11.1–11.20) 485

Chapter 12 Plates and Shells 503

Theoretical Outline 503
Basic Relationships 503
Governing Equations 503
Static Properties of Elastic Plates 505
Shear Plate 508
Pressure Loading, Elastic Range 509
Response of Plates to Pressure Shock Loading in Elastic Range 509
Point Loads, Elastic Range 511
Transient Plate Response to a Point Load 511
Global Response 513
Mass–Plate Impact 514
Limit Values of the Internal Forces and the Onset of Yielding 516
Inelastic Range 518
Static Collapse Load under Pressure Loading 518
Estimates of Dynamic Deflection under Pressure 519
Cylindrical and Spherical Shells 522
Long, Pressurized Cylindrical Shell with No End Constraints 522
Cylindrical Shell with Axisymmetric Load Varying along the Axis 522
Fixed-Ended Cylindrical Shell under Pressure Loading 524
Static Collapse Loads for Cylindrical Shells 526
Shells Stiffened by Equidistant Rings 528
Dynamic Response of Shells 529
Closing Remarks 529
Tabulation of Cases 530
Cases (12.1–12.25) 530
Examples (12.1–12.8) 546

Chapter 13 Dynamic Effects of Explosion 555

Theoretical Outline 555
Physical Effects of an Explosion 555
Instantaneous Explosion Concept; γ-Law 557
Basic Properties of Explosives 558
Spherical Charge Suspended in Air 558
Hemispherical Charge on a Solid Surface 560
Propelling of Solid Container Pieces by Explosive Action 561

Contact Explosion on a Hard Surface 562
Close Proximity Impulse 563
Aboveground Explosion 564
Loads on Fixed, Solid Objects from a Distant Blast 565
Blast Wave Interaction with Movable Solid Bodies 566
Force–Impulse Diagrams 570
Blast Scaling Basics 572
The Effects of Explosions in Ground 573
Closing Remarks 574
Tabulation of Cases 575
Comments 575
Cases (13.1–13.31) 575
Examples (13.1–13.18) 593

Chapter 14 Penetration and Perforation 611

Theoretical Outline 611
Impact against a Semi-Infinite Medium 611
Impact against a Finite-Thickness Target 613
Soil Penetration 614
Concrete Penetration 615
Metal Penetration 617
Kinematics of a Hard Projectile Movement 618
Closing Remarks 620
Tabulation of Cases 621
Comments 621
Cases (14.1–14.17) 621
Examples (14.1–14.7) 633

Chapter 15 Damage, Failure, and Fragmentation 639

Theoretical Outline 639
Pressurized Rings and Shells 639
Static vs. Dynamic Breakup 639
Mechanism of Multiple Fracturing 639
Maximum Number of Fragments from Experiment 641
Radial Motion in Cylindrical Shell under Explosive Pressure 642
Fragmentation Caused by Wave Reflection 643
Spalling Effects in an Axial Bar 643
Breaking of Solids with Stress Waves 644
Failure of Beams 645
The Four Basic Modes of Failure 645
Dynamic Crack Propagation 647
Collapse 648
Dynamic Destruction of a Structural Element 648
Progressive Collapse 650
Rock Breaking 652
Deformability of Cracked Material around Cavity 652

Deformability of Crushed and Cracked Medium in a Cylindrical Cavity 655
Explosive Energy Content 656
Compressive Strength of Rock and an Estimate of Crushed Zone Radius 657
Cylindrical Cavity Expanded by Explosive Pressure, CC Mode 658
Cylindrical Cavity Expanded by Explosive Pressure, Cracking Mode 659
Boulder Breaking 659
Ground Cratering due to Subsurface Explosion 661
Closing Remarks 666
Tabulation of Cases 667
Cases (15.1–15.33) 667
Examples (15.1–15.24) 693

Chapter 16 Selected Examples 715

Theoretical Outline 715
Examples (16.1–16.11) 715

Appendix A Mohr Circles 739

Plane Stress 739
Plane Strain 741
Three-Dimensional State of Stress 741

Appendix B Shortcuts and Approximations 743

Filling Factors 743
Approximate Functions for Small Argument Values 745

Appendix C Aerodynamic Drag Coefficients 747

Appendix D Lamé Equations 749

Thick, Pressurized Ring 749
Thick, Pressurized Spherical Shell 750

References 751
