INELASTICITY OF MATERIALS

An Engineering Approach
and a Practical Guide

Arun R Srinivasa
Sivakumar M Srinivasan

<i>Acknowledgments</i>	xvii
INTRODUCTION TO INELASTICITY	
Simple Structural Elements	1
1. Introduction to Inelasticity	3
1.1 What is inelasticity?	5
1.2 Why should one study inelasticity?	5
1.3 A sample scenario	6
1.4 Observation, experimentation and modeling of material response	8
1.5 Experimental observations and model development	9
1.6 Plastic deformations and the friction block analogy	13
1.7 Creep and time dependent behavior	19
1.8 Summary and Conclusions	26
2. Thermodynamics of Inelastic Materials: A lumped parameter approach	27
2.1 Notion of a lumped parameter model	31
2.1.1 The role of lumped parameter models	31
2.1.2 Elements of lumped parameter systems: Extending the results of Chapter 1	32
2.1.3 Equations of motion	33
2.2 General considerations of springs and dashpots	36
2.2.1 Linear and nonlinear springs	36
2.2.2 Viscous dashpots	39
2.2.3 Frictional dashpots	40
2.2.4 Springs and dashpots in 2 dimensions	43

2.3	Energy formulation of the equations of motion	47
2.4	Mechanical power theorem	48
2.4.1	Frequently asked questions and clarifications	52
2.5	Thermal considerations: The Helmholtz and Gibbs potentials	65
2.5.1	Extension of the power theorem	67
2.5.2	Finding the Helmholtz and Gibbs potentials for a system	76
2.5.3	Determination of the equations of motion and the temperature of the system	78
2.6	Solving the thermo-mechanical evolution equations for an inertialess system	85
2.7	Lumped parameter models: Gibbs potential approach	86
2.8	Projects and exercises	88
3.	Inelastic Response of Truss Elements	89
3.1	An example problem	91
3.2	Inelastic bars under axial loading	93
3.2.1	Task 1: Make a preliminary list of the variables of interest	93
3.2.2	Task 2: Make simplifying assumptions about the response	93
3.2.3	Task 3: Modeling of the response of the truss	95
3.3	Prescribed displacements	110
3.4	The Bauschinger effect	112
3.4.1	Modeling the Bauschinger effect	114
3.5	An example cyclic loading problem	116
3.5.1	Stress cycling	116
3.5.2	Strain cycling	117
3.6	General loading conditions	119
3.7	Summary	122
4.	Elastoplastic Beams:	
	An Introduction to a Boundary Value Problem	125
4.1	An example task	127
4.2	Modeling of a thermoelastoplastic beam	127
4.3	The elastoplastic beam	130
4.3.1	Task 1: Make a preliminary list of variables of interest	130
4.3.2	Task 2: Make simplifying assumptions on the response	131
4.3.3	Task 3: Modeling the response of the beam	132
4.3.4	Task 4: Formulate the solution strategy	139
4.3.5	Problem 1: No axial confinement	140
4.3.6	Problem 2: Beam with axial confinement	144
4.3.7	Statically indeterminate problems / general beam problems	145
4.4	Summary	149
4.5	Projects	149

5.	Simple Problems	151
5.1	Case Study I: Rehabilitation of a crane girder	153
5.2	Case Study II: Passive Damping of a frame structure using super- elastic shape memory alloys (SMA) bracings	158
5.2.1	Modeling the material response	160
5.2.2	Modeling the SMA braced frame	164
5.2.3	Dynamic analysis of the SMA braced system	170
5.2.4	Simulation studies	171
INELASTICITY OF CONTINUA		
Small Deformations		177
6.	Introduction to Small Deformation Plasticity	179
6.1	An example task	181
6.2	The J2 rigid-plasticity model	182
6.2.1	3-D kinematics ,	182
6.2.2	3-D equations of motion	183
6.2.3	Constitutive laws: The J2 rigid plasticity equations	183
6.2.4	Standard form for rigid plastic (Kuhn-Tucker form)	187
6.2.5	Example problems	188
6.3	The J2 elasto-plasticity model	190
6.3.1	The value of ϕ and the “tangent modulus”	194
6.3.2	Non-dimensionalization	200
6.4	Hardening and the plastic arc length	201
6.4.1	Definition of hardening, softening and perfectly plastic be- havior	201
6.5	Finding the response of the material	206
6.5.1	Finding the tangent modulus	207
6.6	Summary	209
6.7	Projects	211
6.8	Homework	211
7.	The Boundary Value Problem for J2 Elastoplasticity	213
7.1	The governing equations	215
7.1.1	3-D case	215
7.1.2	Compatibility equations	217
7.2	Plane problems	218
7.2.1	Plane strain	218
7.2.2	Plane stress	221
7.3	The stress function and the equations of compatibility	226
7.4	Boundary conditions for the stress function	227

7.5	Numerical solution	231
7.5.1	Modifying the MATLAB PDE toolbox to solve elastoplasticity problems	232
7.6	Concluding remarks and summary	233
7.7	Projects	233
8.	Examples of Other Yield Surfaces: Associative and Non-associative Plasticity	237
8.1	The general, small strain elastoplastic model	239
8.1.1	General characteristics of yield surfaces	239
8.2	Examples of general yield surfaces	242
8.2.1	Pressure dependent yielding and the strength-differential or S-D effect	242
8.2.2	Three-invariant or isotropic yield functions	242
8.2.3	Anisotropic yield functions	247
8.3	Examples of plastic potentials and non-associative flow rules	249
8.4	Changes in the size, location and shape of yield surfaces and methods to quantify them	252
8.4.1	Isotropic hardening	256
8.4.2	The Bauschinger effect, the back stress α and certain predictable characteristics of cyclic loading	257
8.4.3	Quadratic yield surface plasticity with kinematic hardening	258
8.4.4	Homogeneous motions and governing differential equations	261
8.5	Summary	262
8.6	Projects	263
8.7	Exercises	264
9.	Thermodynamics of Elasto-plastic Materials: The Central Role of Dissipation	265
9.1	Generalization of J2 plasticity: the rationale	267
9.2	Foundations of the thermodynamics of continua	270
9.2.1	Governing balance laws for small deformation	270
9.2.2	The macroscopic state variables	272
9.3	The entropy and the equation of state	276
9.3.1	Equations of state	277
9.3.2	Heating and working	279
9.4	Equivalent forms of the equation of state: Legendre transformations	281
9.4.1	The Helmholtz potential	282
9.4.2	Further transformations: The Gibbs potential	285
9.5	The “heat” or entropy equation and dissipative processes	286
9.5.1	Results in terms of the Helmholtz potential	288

9.5.2	Generalization of the state variables and obtaining small-strain, continuum versions of spring-dashpot models	290
9.6	Constitutive Laws for $\dot{\varepsilon}_p$ and the satisfaction of the second law	294
9.6.1	Viscoelastic and viscoplastic models	295
9.6.2	Rate independent models without yield criteria	296
9.7	The maximum rate of dissipation criterion	297
9.7.1	Graphical understanding of the MRDH	304
9.8	Rate-independent plasticity: How to get the yield function and the flow rule by using MRDH	305
9.8.1	The yield function	306
9.9	The Bauschinger effect and history dependence	309
9.9.1	A simple model for the Bauschinger effect	312
9.10	Summary	316
9.11	Homework	318
10.	Numerical Solutions of Boundary Value Problems	319
10.1	Background	321
10.2	The modeling exercise	322
10.3	The mesh-free method	326
10.3.1	Moving least squares approximation	327
10.3.2	Weak form of the balance law	334
10.3.3	Generating and solving the nonlinear algebraic equations .	337
10.4	Integration of the plastic flow equations	339
10.4.1	Non-dimensionalization and its importance	339
10.4.2	The convex cutting plane algorithm	342
10.4.3	Homogeneous deformation examples	345
10.5	Numerical examples of boundary value problems	346
10.5.1	Rod with varying cross-section	346
10.5.2	Plate with a hole subjected to tension	347
INELASTICITY OF CONTINUA		
Finite Deformations		353
11.	Summary of Continuum Thermodynamics	355
11.1	Overview of kinematics for finite deformation	357
11.1.1	Temporal and spatial gradients of the motion	359
11.1.2	Local motion: Deformation of line, area and volume elements	360
11.1.3	Sequential versus simultaneous action	364
11.1.4	Stretch and rotation	366
11.2	Strain measures	373
11.3	Dynamics and thermodynamics of motion	377

11.3	Dynamics and thermodynamics of motion	377
11.3.1	Thermodynamics or how to avoid creating perpetual motion machines	380
11.3.2	Constitutive equations for thermoelasticity	383
11.3.3	Isotropic elastic materials: Large strain	386
11.4	Invariant and objective tensors	389
11.4.1	When is a tensor objective?	393
11.4.2	Other rotating frames	396
11.4.3	Why do we not need to worry about objective rates?	396
12.	Finite Deformation Plasticity	399
12.1	Introduction to finite deformation inelasticity	401
12.1.1	The objective of a finite inelasticity constitutive model	403
12.2	Classification of different macroscopic inelasticity models	405
12.3	Recapitulation of small deformation inelasticity results	407
12.4	How to develop a minimalist model for isotropic inelastic materials subject to finite deformation	408
12.4.1	The modeling procedure	410
12.5	Dissipative behavior of inelastic materials	417
12.5.1	Isotropic hardening in finite plasticity	430
12.6	Loading/unloading criteria and the value of ϕ ; The advantages of strain space yield functions	432
12.6.1	Results in terms of eigenvalues	437
12.7	Numerical implementation of the plastic flow equations using the Convex Cutting Plane Algorithm	439
12.8	Summary	442
12.9	Moving natural states, aka multiplicative decompositions	442
12.10	Geometrical significance of \mathbf{D}_p	448
12.11	The model can be extended to viscoplasticity and other dissipative responses	449
12.12	Homework projects and exercises	453
13.	Inelasticity of Single Crystals	455
13.1	Why is the study of the plasticity of single crystals important?	457
13.2	Crystals and lattice vectors	459
13.2.1	A word regarding our approach	459
13.2.2	Introduction to crystal lattices	460
13.3	Lattice deformation and crystallographic slip	462
13.4	Deformation and slip of single crystals	466
13.5	The Helmholtz potential and equation of state for a crystal	470
13.5.1	Thermomechanical equation of state	472
13.6	The dissipation function and constitutive equations for slip	472

13.6.1	Independence of slip systems and other equations for the rate of slip	475
13.6.2	Explicit expressions for the resolved shear stress in terms of the lattice vectors	476
13.6.3	The evolution equation for \mathbf{a}_i	477
13.7	Hardening	483
13.7.1	Phenomenological model of hardening: Single slip	485
13.7.2	Hardening with multiple slip	486
13.8	Concluding remarks	492
13.9	Exercises and projects	493
14.	Advanced Case Studies	495
14.1	Case Study I: Shot Peening - A Process for Creating Wear Resistant Surfaces	497
14.1.1	Background and problem statement	497
14.1.2	Simplifications and assumptions on modeling the system .	498
14.1.3	Sample results of the analysis	500
14.2	Case Study II: Equal Channel Angular Extrusion - A Materials Processing Route	501
14.2.1	Background and problem statement	501
14.2.2	Need analysis and specification of the system	503
14.2.3	Embodiment of the model	505
14.2.4	Concluding remarks	508
14.3	Case Study III: Modeling of an Aging Face - An Application in Biomechanics	509
14.3.1	Background and problem statement	509
14.3.2	Need analysis and specification of the system	510
14.3.3	Embodiment of the model	511
14.3.4	Concluding remarks	513
<i>Bibliography</i>		515
