

SMART PROCESS PLANTS

Software and Hardware Solutions for
Accurate Data and Profitable Operations

Miguel J. Bagajewicz

Contents

Preface	xiii
1 Smart Plants	1
Our Vision	7
Value of Information	7
Book Focus and Contents	8
References	9
2 Measurement Errors	11
Range and Span	11
Precision	11
Origin of Fluctuations	14
Systematic Error (Bias)	14
Outliers	21
Accuracy	27
Calibration Curves	27
Hysteresis and Dead Band	30
Guide to the Expression of Uncertainty in Measurement	30
References	32
3 Variable Classification	35
Linear Model	35
Observability	36
Redundancy	37
Hardware Redundancy	38
Quantification of Observability and Redundancy	38
Estimability	38
Degree of Observability of Variables	38
Degree of Redundancy of Variables	39
Degree of Estimability of Variables	40
Canonical Representation	41
The General Case	48
References	49
4 Material Balance Data Reconciliation	51
Determination of the Measurement Vector	54
Precision of the Estimates	58
Variance of Observable Quantities	59
Method to Avoid the Classification Step	60
References	62

5	Gross Error Detection	65
	Gross Error Handling	66
	Smearing	66
	Tests for Gross Errors	68
	Hypothesis Testing	68
	Type I and Type II Errors and the Power of a Test	70
	Global Test	71
	Nodal Test	72
	Maximum Power Nodal Test	73
	Measurement Test	73
	Maximum Power Measurement Test	74
	Generalized Likelihood Ratio	74
	Principal Component Test	75
	Multiple Gross Errors and Gross Error Elimination	75
	Serial Elimination Strategy Based on the Global Test	76
	Serial Elimination Based on the Measurement Test	77
	Failures of Tests	80
	References	83
6	Equivalency of Gross Errors	87
	Definition	87
	Practical Consequences	88
	Cardinality of Equivalent Sets	88
	Basic Subset of an Equivalent Set	89
	Determination of Equivalent Sets	89
	Practical Consequence	90
	Degeneracy	90
	Quasi-Degeneracy	91
	Quasi-Equivalency	91
	Detection of Leaks	91
	Practical Approach to Equivalency	95
	References	96
7	Gross Error Size Elimination and Estimation	97
	The Compensation Model	97
	Serial Identification with Collective Compensation Strategy (SICC)	98
	The Unbiased Estimation Model (UBET)	99
	Conversion between Equivalent Sets	100
	References	103

8	Nonlinear Data Reconciliation	105
	Component Balances	105
	Splitters	106
	Number of Components	107
	Measurement Pattern	107
	Energy Balances	108
	Heat Exchangers	109
	Full Nonlinear Systems	111
	Gross Error Detection in Nonlinear Systems	115
	Parameter Estimation	116
	References	117
9	Dynamic Data Reconciliation	121
	Filtering	121
	Recursive Filters	121
	Linear Estimators	122
	Discrete Kalman Filter	123
	Quasi-Steady State Estimator	123
	A Balance-Based Quasi-Steady State Estimator	124
	Difference Estimators	125
	Integral Approach	127
	Nonlinear Case	128
	Gross Error Detection	132
	References	134
10	Accuracy of Estimators	139
	Accuracy of Measurements	139
	Induced Bias	140
	Accuracy of Estimators	141
	Maximum Undetected Induced Bias	141
	Maximum Power Measurement	
	Test-Based Software Accuracy	142
	Graphical Representation of	
	Undetected Biases	148
	Effect of Equivalency of Errors	152
	Stochastic Software Accuracy	156
	Monte Carlo Sampling	159
	Instantaneous Testing	162
	Periodic Testing	162
	References	176
11	Economic Value of Accuracy	177
	Value of Precision	177
	Value of Accuracy	181
	Probabilities	182

	Trade-Off between Value and Cost	188
	References	194
12	Data Reconciliation Practical Issues	195
	Data Preprocessing	195
	Use of Filters	196
	Steady-State Recognition and Variance	196
	Variance Estimation	196
	Steady-State Detection	200
	Ratio Test	201
	Tanks and Steady-State Data	
	Reconciliation	204
	Use of Dynamic Data in Steady-State	
	Reconcilers	205
	Random Error Distributions	209
	Multiple Measurements of the	
	Same Variable	209
	Excessive Number of Gross Errors	210
	References	220
13	Value of Control Strategies	225
	Classic Control	225
	Model Predictive Control	233
	The Hierarchy of the Modern Control	
	Architecture	248
	State-Space Process Modeling	251
	Disturbance Modeling	253
	Expected Dynamic Operating Region	
	Characterization	259
	Constrained Minimum Variance Control	265
	Connection between CMV Control and MPC	271
	Control System Value	273
	Impact of Process and Measurement Biases	280
	Conclusions	283
	References	284
14	Value of Parametric Fault Identification	287
	Introduction	287
	Fault Classification	287
	Fault Detection and Diagnosis Techniques	288
	Fault Observability	290
	Single Fault Resolution	297
	Multiple Fault Resolution	298
	Value of Fault Detection	302
	References	309

15	Value of Instrumentation Upgrade—Monitoring and Faults Perspectives	311
	Cost-Optimal Instrumentation Design	313
	Cost-Optimal Design	317
	Cost-Optimal Design for Precision or Accuracy	317
	Tree Search Procedure for the Cost-Optimal Formulation	320
	Branching Criteria	323
	Cost-Optimal Design for Parametric Faults	328
	Integrated Cost-Optimal Design	332
	Value-Optimal Instrumentation Design	334
	References	336
16	Value of Instrumentation Upgrade—Control Perspective	341
	References	350
17	Structural Faults and Value of Maintenance	353
	Maintenance	354
	Maintenance Policies	355
	Reliability, Failure Rate, and Mean Time to Failure	358
	Failure Density Distributions	362
	Exponential Distribution	362
	Weibull Distribution	363
	Normal Distribution	363
	Maintenance Models	364
	Renewal Processes	365
	Markov Processes	378
	Discrete Time Markov Models	385
	Monte Carlo Simulation	388
	Maintenance Policy and Decision Variables	390
	Interfering/Noninterfering Units	391
	Input Data	391
	Spare Parts Inventory	391
	Labor Assignment	392
	Imperfect Maintenance	392
	Maintenance Rules	392
	Monte Carlo Simulation Procedure	393
	Advantages and Limitations	401
	Renewal Process	401
	Markov Process	402
	Monte Carlo Simulation	402
	References	402

xii Contents

18	Maintenance Optimization	405
	Components of Maintenance Optimization	406
	Renewal Process-Based Models	407
	Markov-Based Model	410
	Monte Carlo-Based Models Using Genetic Algorithms	411
	References	421
19	Value and Optimization of Instrument Maintenance	423
	Financial Loss Evaluation	428
	References	435
	Index	437
