ISQM INTERNATIONAL SERIES
IN QUANTITATIVE MARKETING

Contents

Preface	xiii
 PART ONE: Introduction to marketing models	 1
1 Introduction	3
1.1 Purpose	4
1.2 Outline	7
1.3 The model concept	10
2 Classifying marketing models according to degree of explicitness	13
2.1 Implicit models	13
2.2 Verbal models	13
2.3 Formalized models	15
2.4 Numerically specified models	18
3 Benefits from using marketing models	21
3.1 Are marketing problems quantifiable?	21
3.2 Benefits from marketing decision models	24
3.3 Building models to advance our knowledge of marketing	28
3.4 On the use of a marketing model: a case study	32
4 A typology of marketing models	37
4.1 Intended use: descriptive, predictive, normative models	37
4.2 Demand models: product class sales, brand sales, and market share models	40
4.3 Behavioral detail	41
4.4 Time series and causal models	44
4.5 Models of "single" versus "multiple" products	45
 PART TWO: Specification	 47
5 Elements of model building	49
5.1 The model-building process	49
5.2 Some basic model-building terminology	55

5.3	Specification of behavioral equations: some simple examples . . .	66
5.3.1	Models linear in parameters and variables	66
5.3.2	Models linear in the parameters but not in the variables . .	67
5.3.3	Models non-linear in the parameters and not linearizable .	79
6	Marketing dynamics	85
6.1	Modeling lagged effects: one explanatory variable	85
6.2	Modeling lagged effects: several explanatory variables	96
6.3	Selection of (dynamic) models	97
6.4	Lead effects	98
7	Implementation criteria with respect to model structure	101
7.1	Introduction	101
7.2	Implementation criteria	102
7.2.1	Models should be simple	102
7.2.2	Models should be built in an evolutionary way	105
7.2.3	Models should be complete on important issues	105
7.2.4	Models should be adaptive	107
7.2.5	Models should be robust	108
7.3	Can non-robust models be good models?	110
7.4	Robustness related to intended use	115
7.5	Robustness related to the problem situation	120
8	Specifying models according to intended use	123
8.1	Descriptive models	123
8.2	Predictive models	130
8.3	Normative models	144
8.3.1	A profit maximization model	144
8.3.2	Allocation models	151
	Appendix: The Dorfman-Steiner theorem	154
9	Specifying models according to level of demand	157
9.1	An introduction to individual and aggregate demand	157
9.2	Product class sales models	164
9.3	Brand sales models	167
9.4	Market share models	171
10	Specifying models according to amount of behavioral detail	179
10.1	Models with no behavioral detail	180
10.2	Models with some behavioral detail	180
10.3	Models with a substantial amount of behavioral detail	195

11	Modeling competition	201
11.1	Competitor-centered approaches to diagnose competition	202
11.2	Customer-focused assessments to diagnose competition	208
11.3	Congruence between customer-focused and competitor-centered approaches	211
11.4	Game-theoretic models of competition	215
12	Stochastic consumer behavior models	221
12.1	Purchase incidence	222
12.1.1	Introduction	222
12.1.2	The Poisson purchase incidence model	222
12.1.3	Heterogeneity and the Negative Binomial (NBD) purchase incidence model	223
12.1.4	The Zero-Inflated Poisson (ZIP) purchase incidence model	224
12.1.5	Adding marketing decision variables	225
12.2	Purchase timing	226
12.2.1	Hazard models	226
12.2.2	Heterogeneity	229
12.2.3	Adding marketing decision variables	230
12.3	Brand choice models	231
12.3.1	Markov and Bernoulli models	232
12.3.2	Learning models	239
12.3.3	Brand choice models with marketing decision variables	240
12.4	Integrated models of incidence, timing and choice	246
13	Multiproduct models	251
13.1	Interdependencies	252
13.2	An example of a resource allocation model	256
13.3	Product line pricing	258
13.4	Shelf space allocation models	261
13.5	Multiproduct advertising budgeting	264
14	Model specification issues	267
14.1	Specifying models at different levels of aggregation	267
14.1.1	Introduction	267
14.1.2	Entity aggregation	268
14.1.3	Time aggregation	279
14.2	Pooling	281
14.3	Market boundaries	282
14.4	Modeling asymmetric competition	286
14.5	Hierarchical models	291
14.6	A comparison of hierarchical and non-hierarchical asymmetric models	295

PART THREE: Parameterization and validation	299
15 Organizing Data	301
15.1 "Good" data	301
15.2 Marketing management support systems	305
15.3 Data sources	308
15.4 Data collection through model development: A case study	316
16 Estimation and testing	323
16.1 The linear model	324
16.1.1 The two-variable case	324
16.1.2 The <i>L</i> -variable case	325
16.1.3 Assumptions about disturbances	327
16.1.4 Violations of the assumptions	330
16.1.5 Goodness of fit and reliability	348
16.2 Pooling methods	361
16.3 Generalized Least Squares	369
16.4 Simultaneous equations	376
16.5 Nonlinear estimation	383
16.6 Maximum Likelihood Estimation	389
16.6.1 Maximizing the likelihood	389
16.6.2 Example	391
16.6.3 Large sample properties of the ML-Estimator	392
16.6.4 Statistical tests	395
16.7 Non- and semiparametric regression models	396
16.7.1 Introduction	396
16.7.2 Advantages and disadvantages of the parametric regression model	397
16.7.3 The nonparametric regression model	397
16.7.4 The semiparametric regression model	402
16.8 Illustration and discussion	408
16.9 Subjective estimation	413
16.9.1 Justification	413
16.9.2 Obtaining subjective estimates	416
16.9.3 Combining subjective estimates	428
16.9.4 Combining subjective and objective data	433
16.9.5 Illustration	436
17 Special topics in model specification and estimation	441
17.1 Structural equation models with latent variables	441
17.1.1 Outline of the model and path diagram	441
17.1.2 Seemingly unrelated regression models	449
17.1.3 Errors-in-variables models	449
17.1.4 Simultaneous equations	450

17.1.5	Confirmatory factor analysis	450
17.2	Mixture regression models for market segmentation	451
17.2.1	Introduction	451
17.2.2	General mixture models	452
17.2.3	Mixture regression models	453
17.2.4	Application	455
17.2.5	Concomitant variable mixture regression models	456
17.2.6	Latent Markov mixture regression models	457
17.3	Time-series models	458
17.3.1	Introduction	458
17.3.2	Autoregressive processes	459
17.3.3	Moving average processes	461
17.3.4	ARMA processes	462
17.3.5	Stationarity and unit root testing	463
17.3.6	Integrated processes	465
17.3.7	Seasonal processes	465
17.3.8	Transfer functions	467
17.3.9	Intervention analysis	470
17.4	Varying parameter models	473
18	Validation	479
18.1	Validation criteria	480
18.2	Statistical tests and validation criteria	482
18.3	Face validity	484
18.4	Model selection	487
18.4.1	Introduction	487
18.4.2	Nested models	488
18.4.3	Non-nested models	492
18.4.4	Causality tests	495
18.5	Predictive validity	500
18.6	Illustrations	508
18.7	Validation of subjective estimates	517
PART FOUR:	Use / Implementation	523
19	Determinants of model implementation	525
19.1	Organizational validity	526
19.1.1	Personal factors	526
19.1.2	Interpersonal factors: the model user - model builder inter- face	528
19.1.3	Organizational factors	532
19.2	Implementation strategy dimensions	534
19.2.1	Introduction	534

19.2.2	Evolutionary model building	535
19.2.3	Model scope	538
19.2.4	Ease of use	543
20	Cost-benefit considerations in model building and use	545
20.1	Tradeoffs	546
20.2	The cost of building models	547
20.3	Measuring benefits	548
20.4	Some qualitative examples	553
20.5	General observations	556
21	Models for marketing decisions in the future	565
21.1	Examples of recent developments in model building	565
21.2	The role of models in management decisions	568
21.3	A broader framework	570
	Bibliography	579
	Author Index	617
	Subject Index	637
