

PREFACE	xiii
---------------	------

PART 1 • Introduction

CHAPTER 1 Overview of Finite Element Method	3
1.1 Basic Concept	3
1.2 Historical Background	4
1.3 General Applicability of the Method	7
1.4 Engineering Applications of the Finite Element Method	9
1.5 General Description of the Finite Element Method	9
1.6 One-Dimensional Problems with Linear Interpolation Model	12
1.7 One-Dimensional Problems with Cubic Interpolation Model	24
1.8 Derivation of Finite Element Equations Using a Direct Approach	28
1.9 Commercial Finite Element Program Packages	40
1.10 Solutions Using Finite Element Software	40

PART 2 • Basic Procedure

CHAPTER 2 Discretization of the Domain	53
2.1 Introduction	53
2.2 Basic Element Shapes	53
2.3 Discretization Process	56
2.4 Node Numbering Scheme	63
2.5 Automatic Mesh Generation	65
CHAPTER 3 Interpolation Models	75
3.1 Introduction	75
3.2 Polynomial Form of Interpolation Functions	77
3.3 Simplex, Complex, and Multiplex Elements	78
3.4 Interpolation Polynomial in Terms of Nodal Degrees of Freedom	78
3.5 Selection of the Order of the Interpolation Polynomial	80
3.6 Convergence Requirements	82
3.7 Linear Interpolation Polynomials in Terms of Global Coordinates	85
3.8 Interpolation Polynomials for Vector Quantities	96
3.9 Linear Interpolation Polynomials in Terms of Local Coordinates	99
3.10 Integration of Functions of Natural Coordinates	108
3.11 Patch Test	109
CHAPTER 4 Higher Order and Isoparametric Elements	119
4.1 Introduction	120
4.2 Higher Order One-Dimensional Elements	120
4.3 Higher Order Elements in Terms of Natural Coordinates	121
4.4 Higher Order Elements in Terms of Classical Interpolation Polynomials	130

CONTENTS

	4.5 One-Dimensional Elements Using Classical Interpolation Polynomials	134
	4.6 Two-Dimensional (Rectangular) Elements Using Classical Interpolation Polynomials	135
	4.7 Continuity Conditions	137
	4.8 Comparative Study of Elements	139
	4.9 Isoparametric Elements	140
	4.10 Numerical Integration	148
CHAPTER 5	Derivation of Element Matrices and Vectors	157
	5.1 Introduction	158
	5.2 Variational Approach	158
	5.3 Solution of Equilibrium Problems Using Variational (Rayleigh-Ritz) Method	163
	5.4 Solution of Eigenvalue Problems Using Variational (Rayleigh-Ritz) Method	167
	5.5 Solution of Propagation Problems Using Variational (Rayleigh-Ritz) Method	168
	5.6 Equivalence of Finite Element and Variational (Rayleigh-Ritz) Methods	169
	5.7 Derivation of Finite Element Equations Using Variational (Rayleigh-Ritz) Approach	169
	5.8 Weighted Residual Approach	175
	5.9 Solution of Eigenvalue Problems Using Weighted Residual Method	182
	5.10 Solution of Propagation Problems Using Weighted Residual Method	183
	5.11 Derivation of Finite Element Equations Using Weighted Residual (Galerkin) Approach	184
	5.12 Derivation of Finite Element Equations Using Weighted Residual (Least Squares) Approach	187
	5.13 Strong and Weak Form Formulations	189
CHAPTER 6	Assembly of Element Matrices and Vectors and Derivation of System Equations	199
	6.1 Coordinate Transformation	199
	6.2 Assemblage of Element Equations	204
	6.3 Incorporation of Boundary Conditions	211
	6.4 Penalty Method	219
	6.5 Multipoint Constraints—Penalty Method	223
	6.6 Symmetry Conditions—Penalty Method	226
	6.7 Rigid Elements	228
CHAPTER 7	Numerical Solution of Finite Element Equations	241
	7.1 Introduction	241
	7.2 Solution of Equilibrium Problems	242
	7.3 Solution of Eigenvalue Problems	251
	7.4 Solution of Propagation Problems	262
	7.5 Parallel Processing in Finite Element Analysis	268
PART 3	• Application to Solid Mechanics Problems	
CHAPTER 8	Basic Equations and Solution Procedure	277
	8.1 Introduction	277
	8.2 Basic Equations of Solid Mechanics	277

8.3 Formulations of Solid and Structural Mechanics	294
8.4 Formulation of Finite Element Equations (Static Analysis).....	299
8.5 Nature of Finite Element Solutions.....	303
CHAPTER 9 Analysis of Trusses, Beams, and Frames	311
9.1 Introduction	311
9.2 Space Truss Element.....	312
9.3 Beam Element.....	323
9.4 Space Frame Element.....	328
9.5 Characteristics of Stiffness Matrices	338
CHAPTER 10 Analysis of Plates	355
10.1 Introduction	355
10.2 Triangular Membrane Element.....	356
10.3 Numerical Results with Membrane Element.....	367
10.4 Quadratic Triangle Element.....	369
10.5 Rectangular Plate Element (In-plane Forces).....	372
10.6 Bending Behavior of Plates.....	376
10.7 Finite Element Analysis of Plates in Bending.....	379
10.8 Triangular Plate Bending Element.....	379
10.9 Numerical Results with Bending Elements.....	383
10.10 Analysis of Three-Dimensional Structures Using Plate Elements....	386
CHAPTER 11 Analysis of Three-Dimensional Problems.....	401
11.1 Introduction	401
11.2 Tetrahedron Element.....	401
11.3 Hexahedron Element.....	409
11.4 Analysis of Solids of Revolution.....	413
CHAPTER 12 Dynamic Analysis.....	427
12.1 Dynamic Equations of Motion.....	427
12.2 Consistent and Lumped Mass Matrices.....	430
12.3 Consistent Mass Matrices in a Global Coordinate System.....	439
12.4 Free Vibration Analysis.....	440
12.5 Dynamic Response Using Finite Element Method.....	452
12.6 Nonconservative Stability and Flutter Problems.....	460
12.7 Substructures Method.....	461

PART 4 • Application to Heat Transfer Problems

CHAPTER 13 Formulation and Solution Procedure.....	473
13.1 Introduction	473
13.2 Basic Equations of Heat Transfer.....	473
13.3 Governing Equation for Three-Dimensional Bodies.....	475
13.4 Statement of the Problem.....	479
13.5 Derivation of Finite Element Equations.....	480
CHAPTER 14 One-Dimensional Problems.....	489
14.1 Introduction	489
14.2 Straight Uniform Fin Analysis.....	489
14.3 Convection Loss from End Surface of Fin.....	492
14.3 Tapered Fin Analysis.....	496
14.4 Analysis of Uniform Fins Using Quadratic Elements.....	499

CONTENTS

14.5	Unsteady State Problems	502
14.6	Heat Transfer Problems with Radiation	507
CHAPTER 15	Two-Dimensional Problems	517
15.1	Introduction	517
15.2	Solution	517
15.3	Unsteady State Problems	526
CHAPTER 16	Three-Dimensional Problems	531
16.1	Introduction	531
16.2	Axisymmetric Problems	531
16.3	Three-Dimensional Heat Transfer Problems	536
16.4	Unsteady State Problems	541
 PART 5 • Application to Fluid Mechanics Problems		
CHAPTER 17	Basic Equations of Fluid Mechanics	549
17.1	Introduction	549
17.2	Basic Characteristics of Fluids	549
17.3	Methods of Describing the Motion of a Fluid	550
17.4	Continuity Equation	551
17.5	Equations of Motion or Momentum Equations	552
17.6	Energy, State, and Viscosity Equations	557
17.7	Solution Procedure	557
17.8	Inviscid Fluid Flow	559
17.9	Irrotational Flow	560
17.10	Velocity Potential	561
17.11	Stream Function	562
17.12	Bernoulli Equation	564
CHAPTER 18	Inviscid and Incompressible Flows	571
18.1	Introduction	571
18.2	Potential Function Formulation	573
18.3	Finite Element Solution Using the Galerkin Approach	573
18.4	Stream Function Formulation	584
CHAPTER 19	Viscous and Non-Newtonian Flows	591
19.1	Introduction	591
19.2	Stream Function Formulation (Using Variational Approach)	592
19.3	Velocity–Pressure Formulation (Using Galerkin Approach)	596
19.4	Solution of Navier–Stokes Equations	598
19.5	Stream Function–Vorticity Formulation	600
19.6	Flow of Non-Newtonian Fluids	602
19.7	Other Developments	607
 PART 6 • Solution and Applications of Quasi-Harmonic Equations		
CHAPTER 20	Solution of Quasi-Harmonic Equations	613
20.1	Introduction	613
20.2	Finite Element Equations for Steady-State Problems	615
20.3	Solution of Poisson’s Equation	615
20.4	Transient Field Problems	622

**PART 7 • ABAQUS and ANSYS Software and MATLAB® Programs
for Finite Element Analysis**

CHAPTER 21	Finite Element Analysis Using ABAQUS	631
21.1	Introduction	631
21.2	Examples	632
CHAPTER 22	Finite Element Analysis Using ANSYS	663
22.1	Introduction	663
22.2	GUI Layout in ANSYS	664
22.3	Terminology	664
22.4	Finite Element Discretization	665
22.5	System of Units	667
22.6	Stages in Solution	667
CHAPTER 23	MATLAB Programs for Finite Element Analysis	683
23.1	Solution of Linear System of Equations Using Choleski Method	684
23.2	Incorporation of Boundary Conditions	686
23.3	Analysis of Space Trusses	687
23.4	Analysis of Plates Subjected to In-plane Loads Using CST Elements	691
23.5	Analysis of Three-Dimensional Structures Using CST Elements	694
23.6	Temperature Distribution in One-Dimensional Fins	697
23.7	Temperature Distribution in One-Dimensional Fins Including Radiation Heat Transfer	698
23.8	Two-Dimensional Heat Transfer Analysis	699
23.9	Confined Fluid Flow around a Cylinder Using Potential Function Approach	701
23.10	Torsion Analysis of Shafts	702
Appendix: Green-Gauss Theorem (Integration by Parts in Two and Three Dimensions)		705
Index		707
