Foreword	x
Preface	xi
<b>* Epidemiology is</b>	<b>1</b>
A case of food poisoning	3
Subdisciplines of epidemiology	4
On epidemics	6
An historical epidemic	8
The beginnings	9
What does epidemiology offer?	17
What do epidemiologists do?	18
A natural experiment	24
Conclusions	24
References	27
<b>2 How long is a piece of string? Measuring disease frequency</b>	<b>29</b>
What are we measuring?	30
The concepts: prevalence and incidence	32
Measuring disease occurrence in practice: epidemiological studies	38
Measuring disease occurrence in practice: using routine data	45
Other measures commonly used in public health	52
Measuring the 'burden of disease'	59
Summary	68
Questions	68
References	69
<b>3 Who, what, where and when? Descriptive epidemiology</b>	<b>71</b>
Case reports and case series	72
Prevalence surveys	74
Routine data collections	76
Sources of summary data	83
Creative use of existing data	87

Confidentiality	92
Summary	92
References	92
<b>4 Healthy research: study designs for public health</b>	<b>94</b>
Observational studies	96
Intervention studies	112
A word about ethics	117
Summary	121
Questions	121
References	122
<b>5 Why? Linking exposure and disease</b>	<b>125</b>
Looking for associations	126
Ratio measures (relative risk)	128
Difference measures (attributable risk)	133
Relative risk versus attributable risk: an example	141
Case-control studies	143
Summary	149
Questions	149
References	153
<b>6 Heads or tails: the role of chance</b>	<b>154</b>
Random sampling error	154
Confidence intervals (CI)	156
Statistics in epidemiology	158
Statistical versus clinical significance	163
A final word about confidence intervals and <i>p</i> -values	165
Summary	165
Questions	165
References	166
<b>7 All that glitters is not gold: the problem of error</b>	<b>167</b>
Sources of error in epidemiological studies	169
Selection bias	169
Measurement or information error	181
Summary	194
Questions	194
References	196
<b>8 Muddied waters: the challenge of confounding</b>	<b>197</b>
An example of confounding: is alcohol a risk factor for lung cancer?	198
Criteria for a confounder	201
The effects of confounding	202
Control of confounding	208

---

Confounding: the bottom line	218
Questions	219
References	220
<b>9 Reading between the lines: reading and writing epidemiological papers</b>	<b>221</b>
The research question and study design	222
The study sample: selection bias	223
Measuring disease and exposure: measurement bias	226
Confounding	228
Chance	230
Study validity	230
Descriptive studies	232
Writing papers	233
Summary: one swallow doesn't make a summer	234
Questions	235
References	235
<b>10 Who sank the boat? Association and causation</b>	<b>237</b>
What do we mean by a cause?	238
Association versus causation	242
Evaluating causation	243
Evaluating causality in practice: does <i>H. pylori</i> cause stomach cancer?	250
And then what?	250
References	251
<b>11 Assembling the building blocks: reviews and their uses</b>	<b>252</b>
What is a systematic review?	253
Identifying the literature	253
Different types of study	256
Summarising the data	259
Assessment of causality	265
Assessing the quality of a systematic review	267
Making judgements in practice	267
The end result	272
Summary	273
References	273
<b>12 Outbreaks, epidemics and clusters</b>	<b>276</b>
Professor Adrian Sleight <i>National Centre for Epidemiology and Population Health, Australian National University</i>	
Outbreaks, epidemics, endemics and clusters	278
Rare disease clusters	279

Epidemiology of infectious diseases	282
A causal model	285
What influences the spread of infectious diseases?	286
Epidemics or outbreaks	293
Investigating outbreaks	295
Epidemic prevention	299
Tuberculosis: a case study	300
Conclusion	304
Questions	304
References	305
<b>13 Watching not waiting: surveillance and epidemiological intelligence</b>	<b>307</b>
The scope of surveillance	309
Types of surveillance	312
Surveillance in practice	315
Evaluation of surveillance	321
Summary	321
References	322
<b>14 Prevention: better than cure?</b>	<b>323</b>
Disease prevention in public health	323
The scope for preventive medicine	328
Strategies for prevention	331
The population attributable fraction as a guide to prevention	336
Prevention in practice	339
Evaluation of preventive interventions in practice	341
A final (cautionary) word	342
Question	343
References	343
<b>15 Early detection: what benefits at what cost?</b>	<b>345</b>
Why screen?	346
The requirements of a screening programme	349
Evaluation of a screening programme	361
The negative consequences of a screening programme	370
Summary	371
Questions	372
References	373
<b>16 A final word . . .</b>	<b>375</b>
What does the future hold for epidemiology?	377
Where to now?	382
A final word	385
References	386

---

Answers to questions	388
Appendix 1: Direct standardisation	404
Appendix 2: Standard populations	406
Appendix 3: Calculating cumulative incidence and lifetime risk from routine data	407
Appendix 4: Indirect standardisation	409
Appendix 5: Calculating life expectancy from a life table	411
Appendix 6: The Mantel–Haenszel method for calculating pooled odds ratios	413
Appendix 7: Formulae for calculating confidence intervals for common epidemiological measures	416
Glossary	419
Index	435
