Lőrinc Márton

Nonlinear Control of Vehicles and Robots

AIC

Springer

Contents

1 Introduction 1
1.1 Basic Notions, Background 1
1.2 A Short History 3
1.3 Control Systems for Vehicles and Robots, Research Motivation . . 5
1.4 Outline of the Following Chapters 7

2 Basic Nonlinear Control Methods 11
2.1 Nonlinear System Classes 11
2.1.1 State Equation of Nonlinear Systems 12
2.1.2 Holonomic and Nonholonomic Systems 15
2.1.3 Differentially Flat Systems 24
2.2 Dynamic Model of Simple Systems 30
2.2.1 Dynamic Model of Inverted Pendulum 30
2.2.2 Car Active Suspension Model 33
2.2.3 The Model of the 2 DOF Robot Arm 35
2.3 Stability of Nonlinear Systems 38
2.3.1 Stability Definitions 39
2.3.2 Lyapunov Stability Theorems 40
2.3.3 Barbalat Lemmas 47
2.3.4 Stability of Interconnected Passive Systems 49
2.4 Input–Output Linearization 54
2.5 Flatness Control 57
2.6 Backstepping 60
2.7 Sliding Control 64
2.7.1 Sliding Control of Second Order Systems 65
2.7.2 Control Chattering 67
2.7.3 Sliding Control of Robot 70
2.8 Receding Horizon Control 71
2.8.1 Nonlinear Receding Horizon Control 72
2.8.2 Nonlinear RHC Control of 2D Crane 74
2.8.3 RHC Based on Linearization at Each Horizon 76
2.9 Closing Remarks 76

3 Dynamic Models of Ground, Aerial and Marine Robots 81
3.1 Dynamic Model of Rigid Body 81
3.1.1 Dynamic Model Based on Newton–Euler Equations 82
3.1.2 Kinematic Model Using Euler (RPY) Angles 84
3.1.3 Kinematic Model Using Quaternion 85
3.2 Dynamic Model of Industrial Robot 86
3.2.1 Recursive Computation of the Kinematic Quantities 87
3.2.2 Robot Dynamic Model Based on Appell's Equation 89
3.2.3 Robot Dynamic Model Based on Lagrange's Equation . . . 92
3.2.4 Dynamic Model of SCARA Robot 94
3.3 Dynamic Model of Car 98
3.3.1 Nonlinear Model of Car 99
3.3.2 Input Affine Approximation of the Dynamic Model 102
3.3.3 Linearized Model for Constant Velocity 103
3.4 Dynamic Model of Airplane 104
3.4.1 Coordinate Systems for Navigation 104
3.4.2 Airplane Kinematics 108
3.4.3 Airplane Dynamics 109
3.4.4 Wind-Axes Coordinate System 111
3.4.5 Gravity Effect 112
3.4.6 Aerodynamic Forces and Torques 113
3.4.7 Gyroscopic Effect of Rotary Engine 116
3.4.8 State Equations of Airplane 116
3.4.9 Linearization of the Nonlinear Airplane Model 118
3.4.10 Parametrization of Aerodynamic and Trust Forces and Moments 119
3.5 Dynamic Model of Surface and Underwater Ships 121
3.5.1 Rigid Body Equation of Ship 121
3.5.2 Hydrodynamic Forces and Moments 123
3.5.3 Restoring Forces and Moments 124
3.5.4 Ballast Systems 126
3.5.5 Wind, Wave and Current Models 126
3.5.6 Kinematic Model 130
3.5.7 Dynamic Model in Body Frame 130
3.5.8 Dynamic Model in NED Frame 131
3.6 Closing Remarks 132

4 Nonlinear Control of Industrial Robots 135
4.1 Decentralized Three-Loop Cascade Control 135
4.1.1 Dynamic Model of DC Motor 135
4.1.2 Design of Three-Loop Cascade Controller 138
4.1.3 Approximation of Load Inertia and Disturbance Torque . . 143
4.2 Computed Torque Technique 144
4.3 Nonlinear Decoupling in Cartesian Space 145
4.3.1 Computation of Equivalent Forces and Torques 146

4.3.2 Computation of Equivalent Joint Torques 147
4.3.3 Robot Dynamic Model in Cartesian Space 147
4.3.4 Nonlinear Decoupling of the Free Motion 148
4.4 Hybrid Position and Force Control 149
4.4.1 Generalized Task Specification Matrices 150
4.4.2 Hybrid Position/Force Control Law 151
4.5 Self-Tuning Adaptive Control 152
4.5.1 Independent Parameters of Robot Dynamic Model 152
4.5.2 Control and Adaptation Laws 154
4.5.3 Simulation Results for 2-DOF Robot 156
4.5.4 Identification Strategy 156
4.6 Robust Backstepping Control in Case of Nonsmooth Path 158
4.6.1 Gradient Update Laws for Speed Error 159
4.6.2 Control of 2-DOF Robot Arm Along Rectangle Path 160
4.7 Closing Remarks 166

5 Nonlinear Control of Cars 169
5.1 Control Concept of Collision Avoidance System (CAS) 169
5.2 Path Design Using Elastic Band 170
5.3 Reference Signal Design for Control 172
5.4 Nonlinear Dynamic Model 174
5.5 Differential Geometry Based Control Algorithm 175
5.5.1 External State Feedback Design 176
5.5.2 Stability Proof of Zero Dynamics 178
5.5.3 Simulation Results Using DGA Method 181
5.6 Receding Horizon Control 182
5.6.1 Nominal Values and Perturbations 184
5.6.2 RHC Optimization Using End Constraint 186
5.7 State Estimation Using GPS and IMU 189
5.8 Simulation Results with RHC Control and State Estimation 192
5.9 Software Implementations 192
5.9.1 Standalone Programs 193
5.9.2 Quick Prototype Design for Target Processors 195
5.10 Closing Remarks 195

6 Nonlinear Control of Airplanes and Helicopters 199
6.1 Receding Horizon Control of the Longitudinal Motion of an Airplane 199
6.1.1 Robust Internal Stabilization Using Disturbance Observer . 201
6.1.2 High Level Receding Horizon Control 203
6.1.3 Simulation Results with External RHC and Internal Disturbance Observer 208
6.2 Backstepping Control of an Indoor Quadrotor Helicopter 213
6.2.1 Dynamic Model of the Quadrotor Helicopter 215
6.2.2 Sensor System of the Helicopter 217

6.2.3 State Estimation Using Vision and Inertial Measurements . 226
6.2.4 Backstepping Control Algorithm 230
6.2.5 Embedded Control Realization 236
6.3 Closing Remarks 241

7 Nonlinear Control of Surface Ships 245
7.1 Control System Structure 245
7.1.1 Reference Path Design 247
7.1.2 Line-of-Sight Guidance 247
7.1.3 Filtering Wave Disturbances 248
7.1.4 State Estimation Using IMU and GPS 249
7.2 Acceleration Feedback and Nonlinear PD 254
7.3 Nonlinear Decoupling 255
7.3.1 Nonlinear Decoupling in Body Frame 255
7.3.2 Nonlinear Decoupling in NED Frame 256
7.4 Adaptive Feedback Linearization 257
7.5 MIMO Backstepping in 6 DOF 259
7.6 Constrained Control Allocation 262
7.7 Simulation Results 263
7.8 Closing Remarks 267

8 Formation Control of Vehicles 269
8.1 Selected Approaches in Formation Control of Vehicles 269
8.2 Stabilization of Ground Vehicles Using Potential Field Method . . 270
8.2.1 Low Level Linearizing Controller 270
8.2.2 High Level Formation Controller 272
8.2.3 Passivity Based Formation Stabilization 275
8.3 Simulation Results for UGVs 276
8.4 Stabilization of Marine Vehicles Using Passivity Theory 277
8.4.1 Problem Formulation for Synchronized Path Following . . 278
8.4.2 Control Structure 279
8.4.3 Stability Proof Based on Passivity Theory 280
8.5 Simulation Results for UMVs 283
8.6 Closing Remarks 287

9 Modeling Nonsmooth Nonlinearities in Mechanical Systems 291
9.1 Modeling and Stability of Nonsmooth Systems 291
9.1.1 Modeling and Stability of Switched Systems 292
9.1.2 Modeling, Solution and Stability of Differential Inclusions . 295
9.2 Static Friction Models 298
9.2.1 Stick–Slip Motion 301
9.2.2 Friction-Induced Dead Zone 303
9.3 Dynamic Friction Models 304
9.3.1 Classic Dynamic Friction Models 304
9.3.2 Modified and Advanced Dynamic Friction Models 308
9.4 Piecewise Linearly Parameterized Friction Model 310

9.4.1 Parameter Equivalence with the Tustin Model 312
9.4.2 Modeling Errors 313
9.4.3 Incorporating the Dynamic Effects 313
9.5 Backlash in Mechanical Systems 314
9.6 Closing Remarks 317

10 Mechanical Control Systems with Nonsmooth Nonlinearities 319
10.1 Switched System Model of Mechanical Systems with Stribeck Friction and Backlash 319
10.2 Motion Control 321
10.2.1 Stabilizing Control 322
10.2.2 Extension of the Control Law for Tracking 326
10.2.3 Simulation Results 327
10.3 Friction and Backlash Induced Limit Cycle Around Zero Velocity . 330
10.3.1 Chaotic Measures for Nonlinear Analysis 333
10.3.2 Simulation Measurements 334
10.4 Friction Generated Limit Cycle Around Stribeck Velocities 336
10.4.1 Simulation Results 339
10.4.2 Experimental Measurements 339
10.5 Closing Remarks 341

11 Model Based Identification and Adaptive Compensation of Nonsmooth Nonlinearities 343
11.1 Friction and Backlash Measurement and Identification in Robotic Manipulators 343
11.1.1 Friction Measurement and Identification 345
11.1.2 Backlash Measurement 346
11.1.3 Velocity Control for Measurements 347
11.1.4 Experimental Measurements 349
11.2 Friction Measurement and Identification in Hydraulic Actuators . . 355
11.2.1 Mathematical Model of Hydraulic Actuators 356
11.2.2 Friction Measurement and Identification 358
11.2.3 Experimental Measurements 359
11.3 Nonlinear Control of a Ball and Beam System Using Coulomb Friction Compensation 363
11.3.1 Adaptive Friction Identification 366
11.3.2 Nonlinear Control Algorithm for the Ball and Beam System 367
11.3.3 Experimental Evaluations 368
11.4 Adaptive Payload and Friction Compensation in Robotic Manipulators 371
11.4.1 Simulation Results—Adaptive Friction Compensation in the Presence of Backlash 377
11.4.2 Experimental Measurements 379
11.5 Closing Remarks 382

12 Conclusions and Future Research Directions 385
12.1 Summary 385
12.2 Future Research Directions 387

Appendix A Kinematic and Dynamic Foundations of Physical Systems . 389
A.1 Orientation Description Using Rotations and Quaternion 389
A.1.1 Homogeneous Transformations 389
A.1.2 Orientation Description Using Rotations 391
A.1.3 Orientation Description Using Quaternion 393
A.1.4 Solution of the Inverse Orientation Problem 394
A.2 Differentiation Rule in Moving Coordinate System 396
A.3 Inertia Parameters of Rigid Objects 398
A.4 Lagrange, Appell and Newton–Euler Equations 400
A.4.1 Lagrange Equation 402
A.4.2 Appell Equation 403
A.4.3 Newton–Euler Equations 404
A.5 Robot Kinematics 406
A.5.1 Denavit-Hartenberg Form 406
A.5.2 Direct Kinematic Problem 408
A.5.3 Inverse Kinematic Problem 410
A.5.4 Robot Jacobian 411

Appendix B Basis of Differential Geometry for Control Problems 417
B.1 Lie Derivatives, Submanifold, Tangent Space 417
B.2 Frobenius Theorem 422
B.3 Local Reachability and Observability 428
B.4 Input/Output Linearization, Zero Dynamics 439

References 447
