Chapter 1 Mathematical modeling for product design 1
Introduction 1
Literature review 3
Memetic algorithm and its application to collaborative design 5
Proposed framework for collaborative design 5
Pseudo Code 6
Parameters 8
Pseudo Code lines 8
Forearm crutch design 9
Aluminum union 10
Composite tube 10
Design problem formulation 10
Design agent for weight decision 10
Design agent for strength decision 11
Implementation 12
Results and analysis 14
Conclusion 15
References 16

Chapter 2 Dynamic fuzzy systems modeling 19
Introduction: Decision support systems and uncertainties 19
Decision support systems 20
Uncertainty 21
Fuzziness 22
Fuzzy set specifications 23
Information type I: Sample of very small size 24
Information type II: Linguistic assessment 24

Information type III: Single uncertain measured value 25
Information type IV: Knowledge based on experience 26
Stochastic–fuzzy models 26
Applications 27
Development model 27
The optimization of the fuzzy–stochastic development model 30
Urban transit systems under uncertainty 31
Water resources management under uncertainty 32
Energy planning and management under uncertainty 33
University admissions process in Nigeria: The post-UME test selection saga 33
Conclusions 35
References 36

Chapter 3 Stochastic systems modeling 39
Introduction to model types 39
Material/iconic models 39
Robotic/expert models 39
Mathematical models 40
General problem formulation 41
Systems filtering and estimation 43
Identification 43
Correlation techniques 45
Advantages 47
System estimation 47
Problem formulation 47
Nomenclature 47
Maximum likelihood 47
Least squares/weighted least squares 48
Bayes estimators 48
Minimum variance 49
Partitioned data sets 51
Kalman form 52
Discrete dynamic linear system estimation 52
Observation vector 52
Prediction 53
Filtering 53
Smoothing 53
Continuous dynamic linear system 53
Continuous nonlinear estimation 56
Extended Kalman filter 58
Partitional estimation 58
Invariant imbedding 59
Stochastic approximations/innovations concept 60

Model control—Model reduction, model analysis 62
Introduction 62
Modal approach for estimation in distributed parameter systems 65
Modal canonical representation 66
References 73

Chapter 4 Systems optimization techniques 75
Optimality conditions 75
Basic structure of local methods 81
Descent directions 81
Steepest descent 81
Conjugate gradient 82
Newton methods 82
Stochastic central problems 83
Stochastic approximation 85
General stochastic control problem 85
Intelligent heuristic models 87
Heuristics 87
Intelligent systems 87
Integrated heuristics 88
Genetic algorithms 91
Genetic algorithm operators 92
Applications of heuristics to intelligent systems 95
High-performance optimization programming 96
References 97

Chapter 5 Statistical control techniques 99
Statistical process control 99
Control charts 99
Types of data for control charts 100
Variable data 100
Attribute data 100
X-bar and range charts 100
Data collection strategies 101
Subgroup sample size 101
Advantages of using small subgroup sample size 101
Advantages of using large subgroup sample size 101
Frequency of sampling 102
Stable process 102
Out-of-control patterns 102
Calculation of control limits 104
Plotting control charts for range and average charts 105

Plotting control charts for moving range and individual control charts 106
Case example: Plotting of control chart 106
Calculations 109
Trend analysis 111
Process capability analysis 114
Capable process 115
Capability index 116
Time series analysis and process estimation 120
Correlated observations 120
Time series analysis example 121
Exponentially weighted moving average 124
Cumulative sum chart 125
Engineering feedback control 127
SPC versus APC 129
Statistical process control 129
Automatic process control 129
Criticisms of SPC and APC 130
Overcompensation, disturbance removal, and information concealing 130
Integration of SPC and APC 131
Systems approach to process adjustment 131
ARIMA modeling of process data 132
Model identification and estimation 134
Minimum variance control 135
Process dynamics with disturbance 135
Process modeling and estimation for oil and gas production data 136
Introduction 136
Time series approach–Box and Jenkins methodology 137
The ARIMA model 137
Methodology 138
Decline curve method 139
Statistical error analysis 142
Average relative error 142
Average absolute relative error 142
Forecast root mean square error 143
Minimum and maximum absolute relative error 143
Cumulative ratio error 143
ARIMA data analysis 143
Model identification for series WD1 144
Model identification for series Brock 147
Estimation and diagnostic checking 149
Comparison of results 150
References 153

Chapter 6 Design of experiment techniques 155
Factorial designs 155
Experimental run 158
One-variable-at-a-time experimentation 158
Experimenting with two factors: 2^2 design 161
Estimate of the experimental error 165
Confidence intervals for the effects 166
Factorial design for three factors 167
Fractional factorial experiments 171
A 2^4 factorial design 172
Saturated designs 176
Central composite designs 186
Response surface optimization 186
Applications for moving web processes 187
Dual response approach 190
Case study of application to moving webs 191
Case application of central composite design 193
Analysis of variance 195
Response surface optimization 197
References 200

Chapter 7 Risk analysis and estimation techniques 201
Bayesian estimation procedure 201
Formulation of the oil and gas discovery problem 202
Computational procedure 202
The k-category case 204
Discussion of results 205
Parameter estimation for hyperbolic decline curve 214
Robustness of decline curves 214
Mathematical analysis 215
Statistical analysis 216
Parameter estimation 217
Optimization technique 217
Iterative procedure 219
Residual analysis test 220
Simplified solution to the vector equation 222
Integrating neural networks and statistics for process control 224
Fundamentals of neural network 225
The input function 225
Transfer functions 226
Statistics and neural networks predictions 226
Statistical error analysis 226
Integration of statistics and neural networks 227
References 234

Chapter 8 Mathematical modeling and control of multi-constrained projects 237
Introduction 237
Literature review 238
Methodology 240
Representation of resource interdependencies and multifunctionality 240
Modeling of resource characteristics 242
Resource mapper 245
Activity scheduler 247
Model implementation and graphical illustrations 255
Notations 258
References 259

Chapter 9 Online support vector regression with varying parameters for time-dependent data 261
Introduction 261
Modified Gompertz weight function for varying SVR parameters 263
Accurate online SVR with varying parameters 266
Experimental results 268
Application to time series data 269
Application to feed-water flow rate data 271
Conclusion 276
References 277

Appendix: Mathematical and engineering formulae 279
Index 351
