<i>Preface</i>	<i>page</i>	xi
1 The moving target		1
1.1 Invariance principles and laws of nature		1
1.2 Humanly invented law can always be violated		3
1.3 Where are we headed?		6
2 Neo-classical economic theory		9
2.1 Why study “optimizing behavior”?		9
2.2 Dissecting neo-classical economic theory (microeconomics)		10
2.3 The myth of equilibrium via perfect information		16
2.4 How many green jackets does a consumer want?		21
2.5 Macroeconomic lawlessness		22
2.6 When utility doesn’t exist		26
2.7 Global perspectives in economics		28
2.8 Local perspectives in physics		29
3 Probability and stochastic processes		31
3.1 Elementary rules of probability theory		31
3.2 The empirical distribution		32
3.3 Some properties of probability distributions		33
3.4 Some theoretical distributions		35
3.5 Laws of large numbers		38
3.6 Stochastic processes		41
3.7 Correlations and stationary processes		58
4 Scaling the ivory tower of finance		63
4.1 Prolog		63
4.2 Horse trading by a fancy name		63
4.3 Liquidity, and several shaky ideas of “true value”		64
4.4 The Gambler’s Ruin		67
4.5 The Modigliani–Miller argument		68

## *Contents*

4.6	From Gaussian returns to fat tails	72
4.7	The best tractable approximation to liquid market dynamics	75
4.8	“Temporary price equilibria” and other wrong ideas of “equilibrium” in economics and finance	76
4.9	Searching for Adam Smith’s Invisible Hand	77
4.10	Black’s “equilibrium”: dreams of “springs” in the market	83
4.11	Macroeconomics: lawless phenomena?	85
4.12	No universal scaling exponents either!	86
4.13	Fluctuations, fat tails, and diversification	88
5	Standard betting procedures in portfolio selection theory	91
5.1	Introduction	91
5.2	Risk and return	91
5.3	Diversification and correlations	93
5.4	The CAPM portfolio selection strategy	97
5.5	The efficient market hypothesis	101
5.6	Hedging with options	102
5.7	Stock shares as options on a firm’s assets	105
5.8	The Black–Scholes model	107
5.9	The CAPM option pricing strategy	109
5.10	Backward-time diffusion: solving the Black–Scholes pde	112
5.11	We can learn from Enron	118
6	Dynamics of financial markets, volatility, and option pricing	121
6.1	An empirical model of option pricing	121
6.2	Dynamics and volatility of returns	132
6.3	Option pricing via stretched exponentials	144
	Appendix A. The first Kolmogorov equation	145
7	Thermodynamic analogies vs instability of markets	147
7.1	Liquidity and approximately reversible trading	147
7.2	Replicating self-financing hedges	148
7.3	Why thermodynamic analogies fail	150
7.4	Entropy and instability of financial markets	153
7.5	The challenge: to find at least one stable market	157
	Appendix B. Stationary vs nonstationary random forces	157
8	Scaling, correlations, and cascades in finance and turbulence	161
8.1	Fractal vs self-affine scaling	161
8.2	Persistence and antipersistence	163
8.3	Martingales and the efficient market hypothesis	166
8.4	Energy dissipation in fluid turbulence	169
8.5	Multiaffine scaling in turbulence models	173
8.6	Levy distributions	176

## *Contents*

8.7	Recent analyses of financial data	179
	Appendix C. Continuous time Markov processes	184
9	What is complexity?	185
9.1	Patterns hidden in statistics	186
9.2	Computable numbers and functions	188
9.3	Algorithmic complexity	188
9.4	Automata	190
9.5	Chaos vs randomness vs complexity	192
9.6	Complexity at the border of chaos	193
9.7	Replication and mutation	195
9.8	Why not econobiology?	196
9.9	Note added April 8, 2003	199
	<i>References</i>	201
	<i>Index</i>	207
