

Complex Webs

Anticipating the Improbable

Bruce J. West
and Paolo Grigolini

CAMBRIDGE

Contents

<i>Preface</i>	<i>page ix</i>
Webs	1
1.1 The myth of normalcy	1
1.1.1 Knowledge, information and uncertainty	8
1.1.2 Maximum entropy	14
1.2 Empirical laws	21
1.3 Why people forecasts are usually wrong	34
1.3.1 Power laws, prediction and failure	38
1.4 Recap	41
1.5 Problems	42
References	43
Webs, trees and branches	45
2.1 Natural trees and scaling	50
2.1.1 Two kinds of scaling	52
2.1.2 Physiologic trees	59
2.2 Physiology in fractal dimensions	65
2.2.1 Fractals	66
2.2.2 Temporal scaling	74
2.2.3 Autocorrelation functions and fractal dimensions	77
2.3 Measuring what we cannot know exactly	79
2.3.1 Inverse power laws of Zipf and Pareto	80
2.3.2 Chaos, noise and probability	85
2.4 Scaling physiologic time series	88
2.4.1 Fractal heartbeats	89
2.4.2 Fractal breaths	92
2.4.3 Fractal steps	94
2.5 Some afterthoughts	98
2.6 Problems	99
References	100

3	Mostly linear dynamics	105
3.1	Hamilton's equations	107
3.2	Linear stochastic equations	114
3.2.1	Classical diffusion	118
3.2.2	Linear response theory (LRT)	124
3.2.3	Double-well potential and stochastic resonance	127
3.3	More on classical diffusion	130
3.3.1	The Fokker-Planck equation (FPE)	133
3.3.2	The drift-diffusion model (DDM) of decision making	137
3.3.3	First-passage-time distributions	142
3.4	More on statistics	144
3.4.1	Poisson statistics	145
3.4.2	Statistics with memory	147
3.4.3	Inverse power-law correlations	148
3.5	Moving from Hamiltonians to events	153
3.5.1	Age-specific failure rates	153
3.5.2	Possible forms of failure rates	155
3.5.3	Various Poisson processes	158
3.6	Overview	161
3.7	Problems	162
	References	163
4	Random walks and chaos	166
4.1	Random walks	168
4.1.1	Simple random walks	169
4.1.2	Poisson webs	174
4.2	Fractal random walks	177
4.2.1	The Weierstrass walk	178
4.2.2	Lévy random flights	180
4.2.3	Fractional operator walk	183
4.3	Maps, chaos and strange attractors	188
4.3.1	The logistic equation	190
4.3.2	Strange attractors	198
4.4	Integrable and non-integrable Hamiltonians	202
4.4.1	The surface of section	205
4.4.2	Chaos and linear response theory	208
4.5	Précis	219
4.6	Problems	220
	References	221
5	Non-analytic dynamics	224
5.1	Transition to fractional dynamics	225

5.1.1	Fractional calculus	228
5.1.2	Deterministic fractional dynamics	231
5.2	Some applications	234
5.2.1	The fractional Poisson distribution	234
5.2.2	The Weibull distribution	236
5.3	Fractional stochastic equations	237
5.3.1	The fractional Langevin equation	237
5.3.2	Multiplicative random force	239
5.3.3	Some physiologic multifractals	242
5.4	Spatial heterogeneity	247
5.4.1	Random fields	247
5.4.2	Continuous-time random walks (CTRWs)	250
5.4.3	Infinite moments	254
5.4.4	Scaling solutions	257
5.5	Reiteration	258
5.6	Problems	259
	References	259
6	A brief recent history of webs	262
6.1	Web growth	264
6.1.1	Scale-free webs	265
6.1.2	Communication webs	268
6.2	Graphic properties of webs	275
6.2.1	Random webs	277
6.2.2	Real webs	286
6.2.3	Web failures	294
6.3	Deterministic web models	297
6.3.1	Hierarchal webs	297
6.3.2	From small to ultra-small networks	301
6.4	Reflections	303
6.5	Problems	304
	References	305
7	Dynamics of chance	307
7.1	The master equation	308
7.1.1	Discrete dynamics	309
7.1.2	A synchronized web of two-level nodes	310
7.1.3	Stochastic approximation to a synchronized web	314
7.1.4	The Yule process	317
7.2	General modeling strategy	319
7.2.1	From crucial events to the GME	319
7.2.2	Relaxation of the two-level GME	322
7.2.3	Perturbing the GME	323

7.2.4	Towards a new LRT	326
7.2.5	Stochastic resonance and conventional LRT	327
7.3	The Universality of LRT	331
7.3.1	The Hamiltonian approach to LRT	332
7.3.2	Applying the formalism	334
7.3.3	The experimental approach	336
7.3.4	Theoretical interpretation	340
7.4	The statistical habituation model (SHM)	344
7.4.1	Simple stimulus and renewal theory	346
7.4.2	Information resonance and dishabituation	348
7.4.3	Discussion	349
7.5	Summary	351
7.6	Problems	352
	References	353
8	Synopsis	357
	References	363
	<i>Index</i>	365
